SEARCH REQUEST FORM**Scientific and Technical Information Center**

Requester's Full Name: _____ Examiner #: _____ Date: _____
 Art Unit: _____ Phone Number 30 _____ Serial Number: _____
 Mail Box and Bldg/Room Location: _____ Results Format Preferred (circle): PAPER DISK E-MAIL

If more than one search is submitted, please prioritize searches in order of need.

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: _____

Inventors (please provide full names): _____

Earliest Priority Filing Date: _____

**For Sequence Searches Only* Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.*

STAFF USE ONLY**Type of Search****Vendors and cost where applicable**

Subject: score over length search request, 09/913,800

Hi David,

I need a score over length nucleotide sequence search on SEQ ID NOS:32 and 21 in the above entitled case, which are both 20mers. I need the lower and upper limits to be 8 and 30, respectively, I need any hits that are above 65% complementarity, and please transfer as many hits into the excel program as possible. Please do not search the interference databases at this time.

Thanks,

Doug Schultz

SCORE OVER LENGTH SEARCHES

Attached is a score over length search. This search was developed to overcome limitations in most standard search systems which favor large sequences with high scoring, but lesser overall identity over smaller sequences with higher overall identity. This search is especially useful for relatively small nucleic acid or polypeptide target sequences (antisense, fragments, probes, primers, RNAi, epitopes, haptens, etc.) claimed functionally via a form of hybridization and/or identity language and having defined upper and lower polynucleotide and or polypeptide length limits.

The score over length search is performed by first running the query sequence using examiner-specified identity and polynucleotide or protein length limit parameters, and saving 65,000 hits and 0 alignments from each desired database. The resulting output is reformatted using a Microsoft Word macro and is imported into Excel. The summary table data are then sorted by the ratio of score of each hit sequence divided by its length and the accession numbers for all hits below the examiner's desired score over length parameters are deleted. The remaining accession numbers are used to pull the corresponding sequences from the databases into subdatabases enriched for good hits and the query sequence is re-run against these subdatabases to yield the final results.

The score over length cutoff for this search is ____.

Examiner Please Note: This cover sheet should be included when submitting results to be scanned.

STIC SEARCH RESULTS FEEDBACK FORM

Biotech-Chem Library

Questions about the scope or the results of the search? Contact *the searcher or contact:*

Mary Hale, Information Branch Supervisor
Remsen Bldg. 01 D86
571-272-2507

Voluntary Results Feedback Form

➤ I am an examiner in Workgroup: Example: 1610

➤ Relevant prior art **found**, search results used as follows:

- ☐ 102 rejection
- ☐ 103 rejection
- ☐ Cited as being of interest.
- ☐ Helped examiner better understand the invention.
- ☐ Helped examiner better understand the state of the art in their technology.

Types of relevant prior art found:

- ☐ Foreign Patent(s)
- ☐ Non-Patent Literature
(journal articles, conference proceedings, new product announcements etc.)

➤ Relevant prior art **not found**:

- ☐ Results verified the lack of relevant prior art (helped determine patentability).
- ☐ Results were not useful in determining patentability or understanding the invention.

Comments:

Drop off or send completed forms to STIC-Biotech-Chem Library Remsen Bldg.

DT Human Akt-2 phosphorothioate antisense oligonucleotide SEQ ID NO:21.

DR WPI; 2000-270345/23.

XX Antisense compound for diagnosis and treatment of infection, inflammation

PT and tumor formation is targeted towards the nucleic acid encoding a

PT member of serine/threonine family of kinases.

XX Claim 3; Col 38; 30pp; English.

XX The present invention describes antisense compounds of about 8-30

CC nucleotides in length targeted to the 5' UTR (untranslated region), 3'

CC UTR or coding region of the nucleic acid encoding human Akt-2, which

CC inhibits the expression of human Akt-2. Human Akt-2 is a member of the

CC Akt/PKB family of serine/threonine kinases. The antisense compounds have

CC antiinflammatory, cytostatic and antitumorigenic activities, and can be

CC used in gene therapy. They are useful in inhibiting the expression of

CC human Akt-2 by contacting the cells or the tissues in vitro. They can

CC also be used for diagnosis and treatment of infection, inflammation and

CC tumor formation, and for prophylaxis. The present sequence represents a

CC human Akt-2 phosphorothioate antisense oligonucleotide used in the

CC exemplification of the present invention

XX Determn of DNA after capture by probe immobilised on solid phase - useful

PT in diagnosis and monitoring of viral infections and cancer.

XX Example 2; Page 5; 13pp; German.

XX The sequences AAT08580-95 are examples of probes and capture probes used

CC in a novel method for the quantitative and qualitative determination of

CC DNA sequences. The method involves covalently bonding a capture probe to

CC a solid surface which has been chemically activated by an alcoholic soln.

CC of organosilane and heat. The probe or target sequence then binds to the

CC immobilised capture probe and can be detected by a marker present on the

CC target sequence or using an enzyme conjugate, anti-nucleic acid antibody

CC or second reporter probe. The capture probes AAT08586-92 can be used to

CC detect point mutations in the K-ras proto-oncogene exon 12 sequence, as

CC exemplified by the oligonucleotide AAT08585. (Updated on 25-MAR-2003 to

XX Designing capture oligonucleotide probes for use on a support to which

PT complementary oligonucleotides hybridize with little mismatch.

XX Example 5; Fig 29; 300pp; English.

XX The present invention describes a method (M1) for designing capture

CC oligonucleotide probes (I) for use on a support to which complementary

CC oligonucleotide probes (II) will hybridise with little mismatch, where

CC (I) have melting temperatures within a narrow range. The method is useful

CC for detecting infectious diseases caused by bacterial infectious agents

CC e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal

CC infectious agents e.g. Cryptococcus neoformans, Candida albicans and

CC Aspergillus fumigatus, viruses e.g. T-cell lymphocytotropic virus,

CC Epstein-Barr virus and polio virus, and parasitic infectious agents

CC selected from Onchocerca volvulus, Entamoeba histolytica and Dracunculus

CC medinensis. The method is also useful for detecting genetic defects.

CC as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

CC Detecting cancer involving oncogenes, tumour suppressor genes, or genes

CC involved in DNA amplification, replication, recombination or repair, the

CC cancer is specifically associated with a gene selected from BRCA1 gene,

CC p53 gene, human papillomavirus types 16 and 18 and liver cancers. The

CC method is also used for environmental monitoring, forensics and the food

CC and feed industry, detecting comprises scanning (using e.g. a scanning
CC electron microscope and infrared microscope) the support at the
CC particular sites and identifying if ligation of the oligonucleotide probe
CC sets occurred and correlating (using a computer) identified ligation to a
CC presence or absence of the target nucleotide sequences. AB182074 to
CC AB197546 represent oligonucleotide sequences used in the exemplification
CC of the present invention

XX Detecting nucleic acid data for rapid analysis.
XX Example 6; Page 63; 67pp; Japanese.
XX The invention relates to a method for kinetically detecting nucleic acid
CC data. The method comprises allowing a target nucleic acid and a probe to
CC bind and form a hybrid, and then detecting for it by kinetic collection
CC of the signal data. The method of the invention provides for the high
CC speed detection of nucleic acid data, and is capable of detecting a
CC single base difference between nucleic acid sequences. The present
CC sequence represents a human K-Ras microarray probe used in an example of
CC the invention.

PT or as specific biomolecule capture probes for surface-enhanced laser
PT desorption ionization, comprises human myosin-like protein hGDMLP-1.
XX
XX Disclosure; SEQ ID NO 9837; 214pp; English.
XX
XX The present invention describes a human genome-derived myosin-like
XX protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-
XX 1 can be used in gene therapy and vaccine production. The hGDMLP-1
XX nucleic acids can be used as probes to detect, characterise and quantify
XX hGDMLP-1 nucleic acids in samples, as amplification substrates, to
XX provide initial substrates for the recombinant engineering of hGDMLP-1
XX protein variants having desired phenotypic improvements, and for
XX expressing the proteins. The hGDMLP-1 proteins or polypeptides may be
XX used as immunogens to raise antibodies that specifically recognise hGDMLP
XX -1 proteins, as standards in assays used to determine the concentration
XX and/or amount specifically of hGDMLP proteins, as specific biomolecule
XX capture probes for surface-enhanced laser desorption ionisation, as
XX therapeutic supplement in patients having specific deficiency in hGDMLP-1
XX production, and in vaccines or for replacement therapy. The
XX polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a
XX disorder associated with the expression of hGDMLP-1, in particular heart
XX and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
XX The present sequence represents an oligomer used in the screening of the
XX hGDMLP-1 sequence in the exemplification of the present invention. N.B.

XX PT sample and thus tracking the genetic material.
XX PS
XX PS Example 2; Page 21; 30pp; English.
XX CC
XX CC The invention relates to tracking (M1) genetic material, involves
XX CC attaching a molecular bar code (MBC) to the genetic material to associate
XX CC MBC with the genetic material uniquely, detecting the presence of MBC in
XX CC a sample, and thus tracking the genetic material. The MBC consists of
XX CC essentially of a random series of nucleotides. Also included are
XX CC distinguishing (M2) a unique pairing of a gene of interest with a vector
XX CC from a number of vectors comprising genes, by inserting MBC into a
XX CC molecular bar code insertion site in the vector that comprises the gene
XX CC of interest, thus uniquely associating MBC with the gene of interest in
XX CC the vector, and detecting the presence of MBC in a sample, and thus
XX CC tracking the gene of interest and the vector in the sample, a means for
XX CC specifically identifying a vector comprising genetic information from a
XX CC patient, by inserting a means for identifying the vector that comprises
XX CC the genetic material from the patient, detecting the presence of MBC in a
XX CC sample, and thus identifying the vector containing the genetic material
XX CC from the patient in the sample and, a vector comprising a gene of
XX CC interest and MBC, prepared (M3) by preparing a vector comprising the gene
XX CC of interest to accept MBC by digesting the vector with appropriate
XX CC restriction endonucleases, preparing MBC by synthesising an
XX CC oligonucleotide chain which involves synthesising one strand of a
XX CC restriction endonuclease target site, randomly synthesising 10-100
XX CC nucleotides, and synthesising one strand of a restriction endonuclease
XX CC target site at the other end of the oligonucleotide, preparing a
XX CC complementary strand and annealing it to the synthesised
XX CC oligonucleotides, preparing the double stranded oligonucleotide by
XX CC digesting it with the appropriate restriction endonuclease, and ligating
XX CC the vector with MBC. M1 is useful for tracking the genetic material. M2
XX CC is useful for distinguishing a unique pairing of gene of interest with a
XX CC vector from a number of vectors comprising genes. An MBC is useful for
XX CC monitoring vectors that are subjected to multiple generations of growth.

CC The present sequence is a molecular bar code of the invention

XX CC
XX CC This sequence represents a PCR primer for the autonomous replication
XX CC domain of Gluconobacter oxydans. The invention relates to a DNA
XX CC originating in plasmid pF4 with a domain controlling the autonomous
XX CC replication in Gluconobacter and a domain from which polynucleotides in
XX CC the region unnecessary in the autonomous replication have been wholly or
XX CC partly deleted, with exception of the pF4 body. Transformants transformed
XX CC with the vector can be used to produce physiologically active substances,
XX CC particularly L-sorbose dehydrogenase and/or L-sorbose dehydrogenase and
XX CC 2-keto-L-gulonic acid. The DNAs contain the domain controlling the
XX CC autonomous replication in a bacterium and a domain with polynucleotides
XX CC in the region unnecessary for this function completely or partially
XX CC removed to cut down the size, while other domains of the vector can be
XX CC enlarged by integrating a greater variety of structural genes to impart
XX CC more functions

XX New antisense oligonucleotides used in treatment of, e.g. pulmonary vasoconstriction.

XX Disclosure; Page 62; 120pp; English.

XX The specification describes antisense oligonucleotides (AAX52869-X55271) directed against at least 2 mRNAs selected from target genes, coding and non-coding regions of RNAs corresponding to target genes, gene initiation codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides may be derived from sequences AAX5272-74. These multiple target oligonucleotides (specifically AAX5180-271) can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, including lung diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis, acute asthma, allergies, asthma, impaired respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g. colon cancer, breast cancer, lung cancer, pancreatic cancer, hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as well as all types of cancers which may metastasize or have metastasized to the lungs, including breast and prostate cancer

XX New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstriction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or cancers.

XX Claim 18; Page 448; 1343pp; English.

XX The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischemic conditions, pulmonary vasoconstriction, allergies, asthma, impaired respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukemias, lymphomas, carcinomas, and cancers which may metastasize to the lungs, including breast and prostate cancer. The reduction of the adenosine content of ONs reduces side effects. The A-containing ONs break down with the release of deoxyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the nucleotide sequences given in the sequence listing from the present invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185 sequences are also called SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to AAA33992) are specifically claimed ONs from the present invention. N.B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID NO: sequences given in the sequence listing

 XX Low adenosine (A) content antisense oligonucleotides which do not trigger
 PT adenosine receptors during metabolism, useful e.g. for treating cancers
 PT and respiratory obstructions.
 XX
 XX Claim 14; Page 256; 1592pp; English.
 PS
 XX The present invention describes low adenosine (A) content antisense
 CC oligonucleotides and compositions (I) comprising them. In the antisense
 CC oligonucleotides the A is replaced by a 'Universal' or alternative base.
 CC (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
 CC immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
 CC The antisense oligonucleotides and (I) can be used to down-regulate the
 CC expression and or activity of target polypeptides associated with
 CC lung/respiratory disorders and malignancies, such as stimulating and
 CC activating peptide factors and transmitters, transcription factors,
 CC immunoglobulins and antibodies, antibody receptors, cytokines and
 CC chemokines, endogenously produced specific and non-specific enzymes,
 CC binding proteins, adhesion molecules and their receptors, cytokine and
 CC chemokine receptors, adenosine receptors, bradykinin receptors, central
 CC nervous system (CNS) and peripheral nervous and non-nervous system
 CC receptors, CNS and peripheral nervous and non-nervous system peptide
 CC transmitters, defensins, growth factors, vasoactive peptides and
 CC receptors, binding proteins and malignancy associated proteins. The
 CC antisense oligonucleotides may be used in this way to treat disorders

CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC anti-inflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

XX Set of oligonucleotides, useful for diagnosis and cell typing, is
PT designed to detect single-nucleotide polymorphisms and cytosine
PT methylation status.

XX Claim 1; SEQ ID NO 301995; 29pp + Sequence Listing; German.

XX This invention describes novel oligonucleotide primers or peptide nucleic
CC acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP)
CC and cytosine methylation status in chemically pretreated genomic DNA. The
CC oligonucleotides are used for diagnosis and/or prognosis of cancer and a
CC range of diseases including immune system, gastrointestinal, respiratory,
CC central nervous system, cardiovascular and metabolic disorders. The
CC oligomers are also used for detecting cell type differentiation. ABC00010
CC -ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073
CC represent the oligomers described in the invention. NOTE: The sequence
CC data for this patent did not form part of the printed specification, but
CC was obtained in electronic format from WIPO at

XX
CC The present invention relates to nucleic acid molecules which modulate
CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
CC and enzymatic nucleic acids such as hammerhead ribozymes, DNzymes,
CC inozymes, zinzymes, anberzymes, and G-cleaver ribozymes. Also disclosed
CC are nucleic acid decoy molecules and aptamers that bind to HBV reverse

```

```

CC transcriptase and/or HBV reverse transcriptase primer sequences, as well
CC as oligonucleotides that specifically bind the Enhancer I region of HBV
CC DNA. The nucleic acids may be used to modulate the expression of HBV
CC genes and HBV viral replication. Also disclosed is a method for screening
CC compounds and/or potential therapies directed against HBV, and compounds
CC that modulate the expression and/or replication of HCV. The compounds and
CC methods of the invention are useful for the treatment of degenerative and
CC disease states related to HBV and HCV infection, replication and gene
CC expression such as cirrhosis, liver failure, and hepatocellular
CC carcinoma. The present sequence represents a substrate for one of the HBV
CC enzymatic nucleic acid sequences disclosed in the present invention

XX
PS Claim 179; Page 156; 259pp; English.
XX
CC A method has been developed for the identification of a nucleic acid
CC capable of modulating a process in a biological system. The method

```

CC comprises: (a) introducing into the system a random library of nucleic
 CC acid catalysts (NAC) having a substrate binding domain (SBD), comprising
 CC a random sequence, and a catalytic domain (CD); and (b) identifying NAC
 CC in systems where modulation has occurred and/or determining the sequence
 CC of at least part of the SBDs in such systems. Nucleic acid molecules with
 CC endonuclease activity and catalytic activity, from the present invention,
 CC are used to modulate gene expression in plant and mammalian cells and to
 CC cleave target nucleic acid, particularly for treating systemic diseases
 CC caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic
 CC ascites and infection. They may also be used to detect genetic drift and
 CC mutations in diseased cells and to determine c-raf RNA. Specifically NACs
 CC with RNA-cleaving activity that modulate expression of the Raf gene, are
 CC used to treat cancer, resenosis, psoriasis or rheumatoid arthritis, or
 CC generally any condition associated with the level of c-raf. Introduction
 CC of sugar/phosphate modifications increases stability against nuclease and
 CC activity. AAV90922 to AAV93877 represent NACs that can be used in the
 CC method, specifically for modulating the expression of a Raf gene

PT useful in expressing EDN2 protein for screening candidate drugs to treat
PT diseases related to EDN2 activity.
XX
PS Claim 16; Page 14; 91pp; English.
XX
CC The invention relates to genetic variants of human endothelin 2 (EDN2)
CC gene. EDN2 gene contains 17 polymorphic sites PSI-PS17. The polymorphic
CC variants are useful in studying the expression and function of EDN2, in
CC expressing EDN2 protein for use in screening for candidate drugs to treat
CC diseases related to EDN2 activity, in studying the effect of the
CC variation on the biological activity of EDN2, and the binding affinity of
CC candidate drugs targeting EDN2 for the treatment of hypertension,
CC cardiovascular disorders, renal insufficiency and cerebrovascular
CC conditions. The haplotyping methods are useful in validating EDN2 as a
CC candidate target for treating a specific condition or disease predicted
CC to be associated with EDN2 activity, or in the design of clinical trials
CC of candidate drugs for treating a specific condition or disease
CC associated with EDN2 activity. Allele specific oligonucleotides (ASO) are
CC used as probes and primers, and for detecting polymorphism in EDN2 gene.
CC The present sequence is an ASO primer used to detect polymorphism in

CC human EDN2 gene

PT Detecting specific nucleic acid sequence in sample containing nucleic
PT acids involves amplifying nucleic acid, cleaving amplified products with
PT uracil-DNA glycosylase to obtain DNA segments and detecting segments.
XX
PS Example 2; Col 17; 21pp; English.
XX
CC A new method for detecting specific nucleic acid sequences in a sample
CC involves amplifying the nucleic acid sample by PCR and then cleaving the
CC amplified products with uracil DNA glycosylase (UDG), the resulting DNA
CC fragments are detected using reverse blot hybridisation techniques. The
CC method can be used to distinguish between two different sequences, for
CC example for the detection of a DNA fragment carrying a mutation. The
CC method is useful for detecting the presence or absence of a nucleic acid
CC sequence containing a polymorphic restriction site associated with a
CC diseases such as cystic fibrosis disease, and may be used for detecting
CC infectious diseases. Genetic disorders such as sickle cell anaemia,
CC cystic fibrosis, alpha or beta thalassaemia, muscular dystrophy, and Tay-
CC Sachs disease may also be detected using the method. Oncogenes such as
CC RAS may also be detected using the method, for the diagnosis of certain
CC cancers. The present sequence represents a fragment of the K-ras gene
CC created by UDG cleavage. This sequence is used in an example of the
CC invention and contains the position of a mutation site in K-ras SW480.
CC This fragment and the corresponding wild type fragment (AAA72648) can be
CC used to produce probes specifically to identify the mutation, which can
CC then be used in the method of the invention

XX CC Detecting nucleic acid by hybridization, useful e.g. for diagnosis of
XX PT cancer associated with K-ras gene mutations, in presence of competitor
XX PT oligonucleotide to increase discrimination.
XX PS Claim 12; Page 37; 39pp; German.
XX CC This invention describes a novel method for detecting at least one
XX CC nucleic acid having a specific sequence in a sample. The method comprises
XX CC hybridisation to at least one immobilised probe in the presence of at
XX CC least one oligonucleotide having a sequence similar to the specific
XX CC sequence being investigated. The method of the invention is used for
XX CC genetic analysis, especially for identifying and characterising cancer
XX CC cells, particularly detecting mutations in codons 12, 13 and/or 61 of the
XX CC K-ras gene, e.g. for cancer diagnosis or for monitoring/selection of
XX CC treatment. It can also be used to detect viruses and bacteria,
XX CC particularly for differentiating between genotypes. The use of the second
```

CC oligonucleotide as a competitor improves discrimination between a perfect
CC match and a mismatch in very similar sequences, particularly to
CC discrimination level better than 3:1. The sensitivity, after mutation-
CC enriching amplification and competitive hybridization, is over 1:10,
CC preferably 1:100. This sequence represents a probe used to illustrate the
CC method of the invention

XX PT Registering the presence of immobilized substances on a bio-chip carrier,
PT comprises using a fluorescence scanner, where a pulsed laser excites
PT fluorescent markings to be detected between the pulses with local
PT resolution.

XX PS Example 3; Col 14; 16pp; German.

XX CC The invention relates a method to show the presence of immobilised
CC substances on a carrier, comprising a series of light pulses directed at
CC the defined surface under study as an excitation light beam, fluorescent
CC light is detected between successive light pulses, shown by the carrier
CC substances in the measurement field and the light beams and the carrier
CC are moved in relation to each other until a sufficient surface area has
CC been scanned. The method and system is used for the evaluation of bio-
CC chips, where immobilised substances are held on a flat carrier as fixed
CC biological probes and/or samples bonded in the probes. The probes are
CC nucleic acids and especially oligonucleotides e.g. single- and/or twin-
CC strand DNA, RNA, PNA, LNA in pure or combination forms, antibodies,
CC enzymes, haptens, pesticides, hormones, antibiotics, pharmaceuticals,
CC dyes, synthetic receptors or receptor ligands and the like. The
CC system gives a high local resolution and the non-specific background
CC illumination is eliminated, especially in the evaluation of bio-chips.
CC The present sequence is that of an oligonucleotide probe for detecting
CC mutations in codon 12 of the Ki-ras gene, useful in examples of the
CC invention

XX CC New oligo:nucleotides hybridisable with H-ras or Ki-ras gene nucleic acid
XX - in normal or mutated form, for detecting or modulating gene expression,
XX specifically inhibiting proliferation of cancer cells.

XX PS Claim 105 and 115; Page 37; 104pp; English.

XX CC The sequences given in AAQ62025-38 are antisense phosphorothioate
CC oligonucleotides which are targeted to various regions of Ki-ras
CC oncogene. These oligonucleotides gave significant and reproducible
CC inhibition of the level of Ki-ras mRNA. These oligonucleotides may be
CC used for detecting and modulating, esp. inhibiting, expression of the Ki-
CC ras gene, esp. for inhibiting proliferation of cancer cells, and other
CC conditions associated with Ki-ras oncogene activation. Activated (mutant)
CC Ki-ras can be detected from its differential affinity for particular
CC oligos. (Updated on 25-MAR-2003 to correct PN field.)

XX Liposome-encapsulated oligonucleotides useful for treating or preventing
XX cancers associated with ras gene activation.
XX Example 1; Page 114; 120pp; English.

XX This invention describes novel compositions comprising oligonucleotides
XX (AAX56957-X57017), entrapped within liposomes, that hybridize
XX specifically to a target DNA or mRNA which encodes a mutant or wild-type
XX ras protein. The products of the invention have anticancer activity and
XX specifically bring about the antisense inhibition of ras genes or mRNA.
XX The products of the invention are used to modulate expression of a ras
XX gene in cells, tissue, organs or organisms, particularly to inhibit cell
XX growth and especially to treat or prevent cancers associated with
XX activation of a ras gene. Encapsulating the oligonucleotide reduces the
XX rate at which it is cleared from the blood when compared with non-
XX encapsulated material, and the oligonucleotides become distributed to
XX practically all parts of the body

XX
CC This invention describes novel oligonucleotide primers or peptide nucleic
CC acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP)
CC and cytosine methylation status in chemically pretreated genomic DNA. The
CC oligonucleotides are used for diagnosis and/or prognosis of cancer and a
CC range of diseases including immune system, gastrointestinal, respiratory,
CC central nervous system, cardiovascular and metabolic disorders. The
CC oligomers are also used for detecting cell type differentiation. ABC00010
CC -ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073
CC represent the oligomers described in the invention. NOTE: The sequence
CC data for this patent did not form part of the printed specification, but
CC was obtained in electronic format from WIPO at

PT used as antiviral agents and synthons.
XX PS Claim 179; Page 164; 259pp; English.
XX CC A method has been developed for the identification of a nucleic acid
CC capable of modulating a process in a biological system. The method
CC comprises: (a) introducing into the system a random library of nucleic
CC acid catalysts (NAC) having a substrate binding domain (SBD), comprising
CC a random sequence, and a catalytic domain (CD); and (b) identifying NAC
CC in systems where modulation has occurred and/or determining the sequence
CC of at least part of the SBDs in such systems. Nucleic acid molecules with
CC endonuclease activity and catalytic activity, from the present invention,
CC are used to modulate gene expression in plant and mammalian cells and to
CC cleave target nucleic acid, particularly for treating systemic diseases
CC caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic
CC ascites and infection. They may also be used to detect genetic drift and
CC mutations in diseased cells and to determine c-raf RNA. Specifically NACs

CC with RNA-cleaving activity that modulate expression of the Raf gene, are
CC used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or
CC generally any condition associated with the level of c-raf. Introduction
CC of sugar/phosphate modifications increases stability against nuclease and
CC activity. AAV90922 to AAV93877 represent NACs that can be used in the
CC method, specifically for modulating the expression of a Raf gene

XX PT Enzymatic nucleic acid molecules having a hammer-head motif - used for
PT the treatment of arthritis, induction of graft tolerance or treatment of
PT auto-immune diseases.
XX PS Claim 10; Page 205; 307pp; English.
XX CC The present invention describes a novel enzymatic nucleic acid (ENA)
CC having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues
CC ; (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least
CC ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's
CC can inhibit collagenase and stromelysin production in the synovial
```

CC membrane of joints for the treatment or prevention of arthritis,
CC particularly osteoarthritis or rheumatoid arthritis. The ENA's can also
CC be used to treat antigen presenting cells of a donor to induce tolerance
CC in a recipient to an alloantigen of a donor. They can also be used for
CC enhancing graft tolerance or for treating autoimmune disease, and for
CC treating allergies and other inflammatory conditions. The ENA's can also
CC be used in diagnosis. Ribozyme therapy impacts on the expression of
CC stromelysin without introducing the non-specific effects upon gene
CC expression which accompany treatment with retinoids and dexamethasone.
CC The concentration of ribozyme required to affect a therapeutic treatment
CC is lower than that required of antisense molecules, and is highly
CC specific. The present sequence is used in the exemplification of the
CC present invention

PT New ribozyme(s) for cleaving cholesterol ester transfer protein mRNA -
PT useful for preventing or treating initial development, progression or
PT regression of vascular diseases, esp. familial hypercholesterolaemia.
XX
PS Claim 4; Page 30; 72pp; English.
XX
CC AAT49608-T49863 represent target sequences for the human cholesterol
CC ester transfer protein (CERP) hammerhead (HH) ribozymes (see AAT49881-
CC T50137). CERP is a 74 kD glycoprotein that facilitates neutral lipid
CC transfer between plasma lipoproteins. The numbering of the targets refers
CC to the position of the cleavage site in full length CERP. The ribozyme
CC binds to 5 nucleotides either side of this site, provided the sequence
CC is immediately upstream. The ribozymes are able to cleave mRNA from the

CC gene encoding CERP, thereby blocking synthesis and/or expression of the
CC mRNA. By inhibiting CERP, the reverse cholesterol transport (RCT) pathway
CC can be inhibited (or eliminated) thereby preventing the reduction in size
CC density of the high density lipoproteins (HDL), prolonging HDL half life,
CC and therefore increasing HDL levels. The ribozymes can be used to treat
CC conditions associated with abnormal levels of CERP, specifically familial
CC hypercholesterolaemia, atherosclerosis, peripheral vascular disease,
CC hyperbetalipoproteinaemia, hypoalipoproteinaemia, dyslipidaemia,
CC vascular complications of diabetes, transplant, athrectomy and
CC angioplastic restenosis. By inhibiting CERP, the levels of HDL and low
CC density lipoproteins (LDL), and the HDL:LDL ratio are favourably altered
CC (a decrease in LDL levels, and a corresponding increase in HDL levels).
CC The HH ribozymes can also be used diagnostically to study genetic drift
CC and mutations in diseased cells, and to detect CERP mRNA. As the HH
CC ribozymes target specific regions of the CERP gene, they have low non-
CC specific activity

PS Claim 2; Page 27; 120pp; English.
XX
CC AAX30947-31815 represent tag sequences of transcripts that are
CC differentially expressed in colorectal cancer, in pancreatic cancer, or
CC in both. The tag sequences can be used to identify genes by matching the
CC tag to a gen data base member, or by using the tag sequences as probes to
CC isolate unidentified genes from cDNA libraries. The tag sequences can
CC also be used in a method for diagnosing colon or pancreatic cancer in a
CC sample suspected of being neoplastic. The method comprises comparing the
CC level of at least one transcript in a first sample of a tissue to a
CC second sample, where the first sample is a colonic tissue suspected of
CC being neoplastic and the second sample is a normal human colonic tissue.

CC The transcript is identified by a tag selected from AAX30947-31815. The
CC methods of the invention can be used in the diagnosis, prognosis and
CC treatment of cancer

XX
XX This invention describes novel oligonucleotide primers or peptide nucleic
CC acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP)
CC and cytosine methylation status in chemically pretreated genomic DNA. The
CC oligonucleotides are used for diagnosis and/or prognosis of cancer and a
CC range of diseases including immune system, gastrointestinal, respiratory,
CC central nervous system, cardiovascular and metabolic disorders. The
XX oligomers are also used for detecting cell type differentiation. ABC00010
CC -ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073
CC represent the oligomers described in the invention. NOTE: The sequence
CC data for this patent did not form part of the printed specification, but
CC was obtained in electronic format from WIPO at

 XX Detecting tendency to rifampin resistance caused by mutation in RNA
 PT polymerase beta-subunit gene of Mycobacterium tuberculosis.
 XX
 PS Claim 20; SEQ ID NO 44; 27pp; English.
 XX
 XX The invention relates to a method of detecting a tendency to rifampin
 CC resistance caused by mutations in rpoB gene of Mycobacterium tuberculosis

CC comprising extracting DNA from M. tuberculosis cells, amplifying rpoB
 CC gene to produce fluorescently labelled product, contacting the labelled
 CC product with first and second array of oligonucleotide probes, detecting
 CC fluorescent hybridisation signal and correlating with tendency to
 CC rifampin resistance. The method is useful for detecting a tendency to
 CC rifampin resistance caused by mutations in a rpoB gene of M.
 CC tuberculosis. The method is easy to perform and is cost effective to be
 CC performed on a large-scale basis. The results produced is reliable and
 CC readily detectable. The method is easily adaptable to automation. The
 CC present sequence represents a M. tuberculosis probe.

 PT Use of antisense c-jun, c-fos or jun-B nucleic acids - for preventing and
 PT treating neuronal injury, degeneration, cell death and/or neoplasms.
 XX
 PS Claim 2; Page 40; 86pp; English.
 XX
 CC Antisense nucleic acid hybridising with an area of the mRNA and/or DNA
 CC comprising the genes c-jun, jun-B or c-fos, expression of which plays a
 CC causal role in neuronal injury, degeneration, cell death and/or
 CC neoplasms, can be used to prevent and treat such conditions. c-jun
 CC antisense sequences are described in AAQ83267-321 and AAQ83440-43; jun-B
 CC antisense sequences are described in AAQ83322-63 and AAQ83444-45; and c-
 CC fos antisense sequences are described in AAQ83364-439 and AAQ83446-51.
 CC Preferably the antisense sequences are phosphorothioate oligonucleotides
 CC since these are not destroyed as fast by endogenous factors as naturally
 CC occurring molecules. (Updated on 25-MAR-2003 to correct PN field.)

 XX
 PS Claim 179; Page 164; 259pp; English.
 XX
 CC A method has been developed for the identification of a nucleic acid
 CC capable of modulating a process in a biological system. The method
 CC comprises: (a) introducing into the system a random library of nucleic
 CC acid catalysts (NAC) having a substrate binding domain (SBD), comprising
 CC a random sequence, and a catalytic domain (CD); and (b) identifying NAC
 CC in systems where modulation has occurred and/or determining the sequence
 CC of at least part of the SBDs in such systems. Nucleic acid molecules with
 CC endonuclease activity and catalytic activity, from the present invention,
 CC are used to modulate gene expression in plant and mammalian cells and to

CC cleave target nucleic acid, particularly for treating systemic diseases
 CC caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic
 CC ascites and infection. They may also be used to detect genetic drift and
 CC mutations in diseased cells and to determine c-raf RNA. Specifically NACs
 CC with RNA-cleaving activity that modulate expression of the Raf gene, are
 CC used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or
 CC generally any condition associated with the level of c-raf. Introduction
 CC of sugar/phosphate modifications increases stability against nuclease and
 CC activity. AAV90922 to AAV93877 represent NACs that can be used in the
 CC method, specifically for modulating the expression of a Raf gene

 PT New oligonucleotides, nucleic acid probes and primers are useful for
 PT differentiating drug-resistance and determining infection with tubercle
 PT bacilli.
 XX
 PS Example 1; Page 70; 114pp; English.
 XX
 CC The present invention relates to oligonucleotides based on nucleotide
 CC sequences obtained from both wild-type tubercle bacilli (wtTB) that are
 CC susceptible to a drug and mutant-type tubercle bacilli (mtTB) that are
 CC resistant to a drug. The drugs used in the present invention are
 CC rifampicin (RFP), streptomycin (SM), kanamycin (KM), isoniazid (INH) and
 CC ethambutol (EB). The rpoB gene is responsible for resistance to RFP; the
 CC rrs gene is responsible for resistance to SM and KM; the rpsL gene is
 CC responsible for resistance to SM; the inhA gene is responsible for
 CC resistance to INH; the katG gene is responsible for resistance to INH;
 CC and the embB gene is responsible for resistance to EB. The present
 CC invention also relates to nucleic acid probes having part of a nucleotide
 CC sequence of tubercle bacilli (TB) responsible for drug resistance and
 CC primers used to generate the probes. The present sequence is an
 CC oligonucleotide of the present invention. The oligonucleotides of the

CC present invention can be used to enable the differentiation of drug
 CC resistance and the determination of infection with tubercle bacilli
 CC simultaneously

 PS
 XX The invention relates to a method (M1) of preparing a DNA molecule having
 CC an amplifiable region comprises: (a) obtaining a DNA sample comprising
 CC DNA molecules having regions to be amplified; (b) attaching upstream
 CC adapter molecules to ends of DNA molecules of the sample to provide a
 CC nick translation initiation site; (c) subjecting the DNA molecules to
 CC nick translation comprising DNA polymerisation and 5'-3' exonuclease
 CC activity to produce nick translate molecules; and (d) attaching
 CC downstream adapter molecules to the nick translate molecules to produce
 CC creating hybridisation probes comprising preparing a labelled, amplified
 CC adapter attached nick translate molecules. Also included are: (1)
 CC DNA; (2) shotgun sequencing of DNA; (3) constructing a genomic library;
 CC (4) preparing an unordered DNA library; (5) sequencing a BAC clone; (6)
 CC kits comprising amplifiable DNA; (7) an adapter construct comprising: (a)
 CC a first domain comprising nucleotides that facilitate ligation of the
 CC construct to a nucleic acid; and (b) a second domain proximal to the
 CC first domain, comprising a site which facilitates the initiation of a
 CC nick translation reaction and a site that facilitates recombination,
 CC where ligation of the adapter construct to a polynucleotide results in
 CC the only free 3' OH group capable of initiating a nick translation
 CC reaction within the second domain; (8) an adapter construct comprising:

CC (a) a first oligonucleotide comprising a phosphate group at the 5' end
 CC and a blocking nucleotide at the 3' end; (b) a second oligonucleotide
 CC comprising a blocked 3' end, a non-phosphorylated 5' end, and a
 CC nucleotide sequence complementary to the 5' element of the first
 CC oligonucleotide; and (c) a third oligonucleotide comprising a 3' hydroxyl
 CC group, a non-phosphorylated 5' end, and a nucleotide sequence
 CC complementary to the 3' element of the first oligonucleotide; (9) kits
 CC comprising a DNA polymerase, nucleotide triphosphates, and an adapter
 CC construct; (10) methods of recombining DNA molecules comprising
 CC recombining ends of adapter attached template molecules in a dilute
 CC solution; and (11) a method of detecting a specific DNA sequence. The
 CC method (primer extension/nick translation or PENT also known as
 CC positional amplification by nick translation, PANT) is useful in
 CC producing DNA to be sequenced or amplified with specific regions for
 CC which the sequence is not known, and in producing a genomic library. The
 CC method is useful for sequencing internal regions of short templates using
 CC primary and secondary PENTamers, and complement PENTamers; sequencing
 CC large insert clones using ordered positional libraries of PENTamers;
 CC genomic sequencing; determining gene positions; sequencing and re-
 CC sequencing; cDNA sequencing; diagnosing chromosomal rearrangements;
 CC detecting and identifying organisms and variants of organisms; and
 CC amplifying specific subsets of genomes. The present sequence is a adapter
 CC used to demonstrate the method of the invention

 CC nick translation initiation site; (c) subjecting the DNA molecules to
 CC nick translation comprising DNA polymerisation and 5'-3' exonuclease
 CC activity to produce nick translate molecules; and (d) attaching
 CC downstream adapter molecules to the nick translate molecules to produce
 CC adapter attached nick translate molecules. Also included are: (1)
 CC creating hybridisation probes comprising preparing a labelled, amplified
 CC DNA; (2) shotgun sequencing of DNA; (3) constructing a genomic library;
 CC kits comprising amplifiable DNA; (5) sequencing a genomic library;
 CC a first domain comprising nucleotides that facilitate ligation of the
 CC construct to a nucleic acid; and (b) a second domain proximal to the
 CC first domain, comprising a site which facilitates the initiation of a
 CC nick translation reaction and a site that facilitates recombination,
 CC where ligation of the adapter construct to a polynucleotide results in
 CC the only free 3' OH group capable of initiating a nick translation
 CC reaction within the second domain; (8) an adapter construct comprising:
 CC (a) a first oligonucleotide comprising a phosphate group at the 5' end
 CC and a blocking nucleotide at the 3' end; (b) a second oligonucleotide
 CC nucleotide sequence complementary to the 5' element of the first
 CC oligonucleotide; and (c) a third oligonucleotide comprising a 3' hydroxyl
 CC group, a non-phosphorylated 5' end, and a nucleotide sequence
 CC complementary to the 3' element of the first oligonucleotide; (9) kits
 CC comprising a DNA polymerase, nucleotide triphosphates, and an adapter
 CC construct; (10) methods of recombining DNA molecules comprising
 CC recombining ends of adapter attached template molecules in a dilute
 CC solution; and (11) a method of detecting a specific DNA sequence. The
 CC method (primer extension/nick translation, PANT) is useful in
 CC positional amplification by nick translation or PENT also known as
 CC producing DNA to be sequenced or amplified with specific regions for
 CC which the sequence is not known, and in producing a genomic library. The
 CC method is useful for sequencing internal regions of short templates using
 CC primary and secondary PENTamers, and complement PENTamers; sequencing
 CC large insert clones using ordered positional libraries of PENTamers;
 CC genomic sequencing; determining gene positions; sequencing and re-
 CC sequencing; cDNA sequencing; diagnosing chromosomal rearrangements;
 CC detecting and identifying organisms and variants of organisms; and
 CC amplifying specific subsets of genomes. The present sequence is a
 CC component part of a simplified recombinant adapter (Sra) used in an
 CC example to demonstrate the method of the invention

XX
XX      Producing a library of consecutive overlapping series of nucleic acid
XX      sequences, useful in chromosome walking, comprises generating a first
XX      amplifiable nick translation product, and sequencing a part of the
XX      translation product.
XX
XX      Example 1; Page 84; 160pp; English.
XX
XX      The present invention is directed to chromosome walking through the
XX      generation of adaptor-attached nick translate molecules (designated a
XX      PENTamer). In the simplest implementation, a primary PENTamer is
XX      generated by: ligating a nick-translation first adaptor to the proximal
XX      end of the source DNA (template); initiating a nick translation reaction
XX      at the nick site of the adaptor using a DNA polymerase with 5' to 3'
```

CC exonuclease activity; elongating the PENT product a specific time; and
 CC appending a nick-ligation second adaptor to the distal, 3' end of the
 CC PENT product to form a PENTamer-template hybrid (nascent PENTamer). The
 CC method is useful for: filling gaps in genomic sequencing projects, 1-2
 CC time redundancy genomic sequencing, sequencing unculturable
 CC microorganisms and sequencing mixtures of microorganisms. The present
 CC sequence is that of an adaptor A3 blocking primer. Adaptor A3 (see
 CC AB258041) was used in examples of the invention for the preparation of
 CC primary PENTamer libraries of *Escherichia coli* and human genomic DNA

 PT pancreatic cancer.
 XX
 PS Claim 1; Page 51; 120pp; English.
 XX
 CC AAX30947-31815 represent tag sequences of transcripts that are
 CC differentially expressed in colorectal cancer, in pancreatic cancer, or
 CC in both. The tag sequences can be used to identify genes by matching the
 CC tag to a gen data base member, or by using the tag sequences as probes to
 CC isolate unidentified genes from cDNA libraries. The tag sequences can
 CC also be used in a method for diagnosing colon or pancreatic cancer in a
 CC sample suspected of being neoplastic. The method comprises comparing the
 CC level of at least one transcript in a first sample of a tissue to a
 CC second sample, where the first sample is a colonic tissue suspected of
 CC being neoplastic and the second sample is a normal human colonic tissue.
 CC The transcript is identified by a tag selected from AAX30947-31815. The
 CC methods of the invention can be used in the diagnosis, prognosis and
 CC treatment of cancer

 PS Claim 79; Page 100; 148pp; English.
 XX
 CC The present invention describes nucleic acids (A) that interact stably
 CC with a target sequence and contain at least one phosphoro(dithioate
 CC link, having endonuclease activity. (A), and more generally any catalytic
 CC nucleic acid (A') that modulates expression of the oestrogen receptor
 CC gene, are used to treat cancer (particularly of breast or endometrium), or
 CC in vivo or by transforming cells ex vivo and implanting treated cells, or
 CC for other conditions associated with levels of oestrogen receptor.
 CC Because of the high selectivity for targeted RNA, (A) can also be used to
 CC correlate inhibition of gene expression with alterations in phenotype,
 CC particularly for identification of therapeutic targets, and as research
 CC reagents (for RNA, in the same way that restriction endonucleases are
 CC used with DNA). The combination of modifications in (A) improves
 CC resistance to nucleases, binding affinity and/or activity. AAA23503 to
 CC AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and
 CC AAA24748 to AAA25992 represent their corresponding target sequences.
 CC AAA25993 to AAA26105 represent oestrogen receptor hairpin ribozyme
 CC sequences, and AAA26107 to AAA26218 represent their corresponding target
 CC sequences. AAA26219 to AAA26271 represent other ribozyme sequences and
 CC antisense oligonucleotides used in the exemplification of the present
 CC invention

XX
XX New zinc finger protein that binds to target site, useful in studying
PT gene function and for human therapeutics and plant engineering, comprises
PT first, second and third zinc fingers, ordered from N- to C-terminus.
XX
XX Example 1; Page 63; 81pp; English.
XX
XX The present invention describes a zinc finger protein (I) that binds to a
CC target site, comprising a first (F1), a second (F2), and a third (F3)
CC zinc finger, ordered F1, F2, F3 from N-terminus to C-terminus, where the
CC target site comprises, in 3'-5' direction, a first (S1), a second (S2),
CC and a third (S3) target subsequence. Also described are: (1) a polypeptide
CC (II) comprising (I); (2) a polynucleotide (III) encoding (I) or (II); and
CC (3) designing (W) (i) involves selecting the F1 zinc finger such that it
CC binds to the S1 target subsequence, selecting the F2 zinc finger such that it
CC binds to the S2 target subsequence, and selecting the F3 zinc finger such
CC that it binds to the S3 target subsequence, thus designing (I) that binds to
CC a target site. (I) is useful for recognition of triplet target subsequence
CC having the nucleotide G in the 5'-most position of the subsequence. (I) is
CC useful in studying gene function, and for human therapeutics and plant
CC engineering. (I), (II) or (III) is useful in therapeutic methods to
CC modulate the expression of a target region within a subject, in
CC diagnostic methods for sequence specific detection of target nucleic acid
CC in a sample, and in assays to determine the phenotype and function of
CC gene expression. (I) has improved affinity and specificity for their
CC target sequences, as well as enhanced biological activity. ABQ71213 to
CC ABQ72214 and ABP48191 to ABP51230 represent DNA target sequences and zinc
CC finger peptides which are given in the exemplification of the present
CC invention

XX Yeast gene coding sequences comprising NORF genes with serial analysis of

PT gene expression (SAGE) tags, useful for studying, monitoring and
XX affecting phases of the cell cycle.
XX Example; Page 249; 419pp; English.
XX The present invention describes an isolated DNA molecule comprising a
CC coding sequence of a yeast gene selected from a group of 745 NORF (not
CC previously assigned open reading frame; or nonannotated ORF) genes
CC comprising a SAGE (serial analysis of gene expression) tag. Also
CC described are: (1) a method (M1) of using NORF genes to affect the cell
CC cycle comprising administering a NORF gene whose expression varies by at
CC least 10% between any two phases of the cell cycle selected from log
CC phase, S phase and G2/M; (2) a method (M2) for screening candidate
CC antifungal drugs comprising: (a) contacting a test substance with a yeast
CC cell; and (b) monitoring expression of a NORF gene whose expression
CC varies as in M1, where a test substance which modifies the expression of
CC the yeast gene is a candidate antifungal drug; (3) a method (M3) for
CC identifying human genes which are involved in cell cycle progression
CC comprising contacting human DNA with a probe which comprises at least 10
CC contiguous nucleotides of a NORF gene whose expression varies as in M1;
CC and (4) a method (M4) for identifying a candidate drug as a member of a
CC class of drugs having a characteristic effect on gene expression in a
CC yeast cell comprising contacting a yeast cell with a candidate drug and
CC monitoring expression in the yeast cell of at least 1 NORF gene whose
CC expression is affected by the class of drugs. The NORF genes may be used
CC to study, monitor and affect phases of the cell cycle, the differentially
CC expressed genes may be used as markers of phases of the cell cycle. The
CC methods may be used to identify candidate drugs which affect the cell
CC cycle and for identification of antifungal drugs. AAF33268 to AAF4064
CC represent SAGE tags used in the exemplification of the present invention.

PT Producing nucleic acid array for use in hybridization reactions, by
PT employing adsorptive, non-covalent attachment of nucleic acids and
PT oligonucleotide probes to positively charged solid surfaces.
XX
XX Example 1; Page 29; 46pp; English.
XX
XX The present sequence is a probe used to demonstrate array-based nucleic
CC acid hybridisation. This was an example in a specification relating to a
CC method for producing an array of discrete biosites comprising non-
CC covalently attached nucleic acids. The nucleic acids are useful as probes
CC in hybridisation reactions. The affinity and selectivity of the non-
CC covalently immobilised probe to sample target duplex formation is
CC excellent and compact compared to conventional methods and unlabelled
CC probes are applied at a concentration which is at least five times lower
CC than required for conventional methods

DR
XX
XX Association device for nucleic acid-based diagnostic test, isolation of
PT nucleic acids, comprises oligonucleotide probe and solid substrate having
PT support surface comprising association surface for linking probe to
PT substrate.
XX
XX
XX Example 13; Page 63; 101pp; English.
PS
XX The invention relates to an association/hybridisation device comprising
CC nucleic acid and polypeptide probes, or combinations of these, linked to
CC a porous solid substrate, comprising an external substrate surface and
CC several internal pores. The pore surfaces comprise an association surface
CC which is charged with net positive or negative charge density where the
CC pH is lower or higher than the pI of association surface. The device is
CC useful for associating a nucleic acid or a polypeptide in a sample to a
CC nucleic acid or a polypeptide probe. The device is also useful for

CC detecting a single base pair difference between a nucleic acid in a test
CC sample and an oligonucleotide probe. The device finds application in
CC nucleic acid-based diagnostic tests, isolation and purification of
CC nucleic acids or polypeptides from a sample. The device can be used at
CC any temperature and the kinetics of association between the
CC oligonucleotide probe and the nucleic acid in the test sample are 10 fold
CC more rapid than the kinetics of association under conditions when the
CC substrate surface or association surface has a neutral or net negative
CC charge density. The device and the method can be used for hybridisation
CC of probes to target DNA or RNA at low bulk ion concentrations. The
CC present sequence is that of a k-ras capture probe. As a representative
CC DNA hybridisation model a 157bp PCR fragment of the human k-ras oncogene
CC was used to examine hybridisation rate enhancement under low ionic
CC strength and low pH conditions. The capture probes (AAI65966-AAI65972)
CC comprise biologically significant codon 12 point mutations

 PT New anti-sense DNA oligomers - which decrease ribosomal frame-shifting
 PT and inhibit the expression of viral enzymatic proteins.
 XX
 PS Claim 2; Page 25; 34pp; English.
 XX
 CC The antisense oligonucleotides AAT03073-80 are targeted against specific
 CC regions in the 16S and 18S rRNA of the E. coli and human small ribosomal
 CC subunit, respectively. They can be used to inhibit enzymatic protein
 CC expression by a retrovirus in a host, and are therefore useful in the
 CC treatment of retroviral infections, e.g. HIV, HTLV type 1 or human
 CC retroviruses requiring ribosomal frameshifting for the expression of the
 CC pol gene. The antisense sequences are shown 3' to 5' in the
 CC specification. (Updated on 25-MAR-2003 to correct PI field.)

PT Antisense oligonucleotide(s) complementary to human 18S rRNA - for
PT inhibiting HIV ribosomal frameshifting and enzyme expression.
XX
PS Claim 2; Col 5; 14pp; English.
XX
CC Antisense oligomers AAV04822-29 are targeted against specific regions in
CC the 16S RNA of Escherichia coli small ribosomal subunit. These regions
CC correspond to the human 18S rRNA nucleotides 595-641. The present
CC oligomer is targeted toward positions 528-517. The oligonucleotides
CC decrease the occurrence of ribosomal frameshifting and inhibits the
CC expression of HIV enzymatic proteins. The antisense oligonucleotides are
CC used for treating HIV infections

PT molecules.
XX XX
XX PS Disclosure; Page 56; 58pp; English.
XX XX
XX CC The invention relates to a method of synthesizing DNA molecules useful
CC for generating gene expression profiles. The method involves utilizing
CC RNA molecules as templates to prime the enzymatic synthesis of DNA
CC molecules complementary to the template RNA molecules. The method is
CC useful in preparing nucleic acid samples that are useful for screening
CC populations of immobilised nucleic acid molecules such as DNA molecules
CC immobilised on a DNA microchip. The method may also be used in generating
CC gene expression profiles for purposes of screening, diagnosing or staging
CC a disease, monitoring a response to therapy, or identifying genetic
CC targets of drugs and of pathogens. The processed DNA samples may be
CC utilised in any experiment, process or therapeutic treatment that
CC requires DNA. The invention is useful in gene therapy. The present
CC sequence is a primer used in the synthesis of DNA molecules

XX XX
XX XX Prodn. of RNA fingerprint from poly(A) plus RNA or single-stranded cDNA
PT derived from it - using oligo-nucleotide primers, nucleotide(s) and a
PT terminator nucleotide.

XX Example; Page 25; 43pp; English.

XX This is the target sequence of the band 16 P36 primer which was used as

CC part of the prodn. of an RNA fingerprint of a poly(A)+ RNA prepn. . It has

CC been identified in cytochrome p450 and cysteine proteinase inhibitor RNA

CC (Genbank references HUMCYP219 (1088) and HUMINCP (1280)). The method is

CC useful for analysing and comparing the relative amts. of several hundred

CC of the more abundant individual mRNAs present in different poly(A)+ RNA

CC prepn. . It produces data that can be used to reveal poly(A)+ RNA/cDNA

CC pattern differences for a number of human tissues from several

CC individuals, and identifies changes in RNA patterns between normal

CC tissues and neoplastic human tumours (e.g. myoma of the uterus) and

CC during differentiation of F9 foetal carcinoma cells. Sequencing of the

CC isolated bands is sufficient to provide information for the

CC identification of differentially expressed genes in the GenBank database.

CC This information can be used to allow direct primer extension sequencing

CC of poly(A)+ RNA, PCR amplification/cloning, and identification of

CC differentially expressed genes from a cDNA library using hybridisation.

CC (Updated on 25-MAR-2003 to correct PN field.)

XX

XX Claim 5; Fig 1; 76pp; German.

XX

CC AAV10915-V11123 are target sequences for a novel ribozyme which cleaves

CC specific alleles from the major histocompatibility complex (MHC). This

CC ribozyme contains a catalytic region and a hybridisation region which is

CC complementary to all mRNA transcribed from vertebrate genes of a specific

CC family of closely related MHC alleles or to mRNA from a single MHC

CC allele, and is able to cleave such mRNA. The mRNA has a target region

CC which in case is essentially conserved in all genes of the family but

CC differs from genes of all other MHC alleles to such a degree that no

CC cleavage of mRNA transcribed from these other alleles occurs. This allows

CC the selective reduction or inhibition of expression of all genes of a

CC family or of a single gene. This ribozyme can be used for permanent or

CC transient suppression of expression of MHC alleles, in vivo or in vitro.

CC Specific applications are to prevent guest vs. host or host vs. guest

CC reactions, to prevent blood incompatibilities (partic. of the ABO, rhesus

CC and Kell systems) and to treat autoimmune diseases such as juvenile

CC diabetes and rheumatoid arthritis. The use of this ribozyme avoids the

CC need for immunosuppressants in transplant patients. It provides very

CC specific reduction of particular HLA molecules that cause incompatibility

CC between donor and recipient. (Updated on 25-MAR-2003 to correct PA

CC field.) (Updated on 25-MAR-2003 to correct PI field.)

XX

CC AAV10915-V11123 are target sequences for a novel ribozyme which cleaves
 CC specific alleles from the major histocompatibility complex (MHC). This
 CC ribozyme contains a catalytic region and a hybridisation region which is
 CC complementary to all mRNA transcribed from vertebrate genes of a specific
 CC family of closely related MHC alleles or to mRNA from a single MHC
 CC allele, and is able to cleave such mRNA. The mRNA has a target region
 CC which in case is essentially conserved in all genes of the family but
 CC cleavage of mRNA transcribed from these other alleles occurs. This allows
 CC the selective reduction or inhibition of expression of all genes of a
 CC family or of a single gene. This ribozyme can be used for permanent or
 CC transient suppression of expression of MHC alleles, in vivo or in vitro.
 CC Specific applications are to prevent guest vs. host or host vs. guest
 CC reactions, to prevent blood incompatibilities (partic. of the ABO, rhesus
 CC and Kell systems) and to treat autoimmune diseases such as juvenile
 CC diabetes and rheumatoid arthritis. The use of this ribozyme avoids the
 CC need for immunosuppressants in transplant patients. It provides very
 CC specific reduction of particular HLA molecules that cause incompatibility
 CC between donor and recipient. (Updated on 25-MAR-2003 to correct PA

XX Set of oligonucleotides, useful for diagnosis and cell typing, is
PT designed to detect single-nucleotide polymorphisms and cytosine
PT methylation status.
XX Claim 1; SEQ ID NO 89259; 29pp + Sequence Listing; German.
XX This invention describes novel oligonucleotide primers or peptide nucleic
XX acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP)
CC and cytosine methylation status in chemically pretreated genomic DNA. The
CC oligonucleotides are used for diagnosis and/or prognosis of cancer and a
CC range of diseases including immune system, gastrointestinal, respiratory,
CC central nervous system, cardiovascular and metabolic disorders. The
CC oligomers are also used for detecting cell type differentiation. ABC00010
CC -ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073
CC represent the oligomers described in the invention. NOTE: The sequence
CC data for this patent did not form part of the printed specification, but
CC was obtained in electronic format from WIPO at

XX Set of oligonucleotides, useful for diagnosis and cell typing, is
PT designed to detect single-nucleotide polymorphisms and cytosine
PT methylation status.
XX
XX Claim 1; SEQ ID NO 109478; 29pp + Sequence Listing; German.
XX
XX This invention describes novel oligonucleotide primers or peptide nucleic
CC acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP)
CC and cytosine methylation status in chemically pretreated genomic DNA. The
CC oligonucleotides are used for diagnosis and/or prognosis of cancer and a
CC range of diseases including immune system, gastrointestinal, respiratory,
CC central nervous system, cardiovascular and metabolic disorders. The
CC oligomers are also used for detecting cell type differentiation. ABC00010
CC -ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073
CC represent the oligomers described in the invention. NOTE: The sequence
CC data for this patent did not form part of the printed specification, but
CC was obtained in electronic format from WIPO at
CC ftp.wipo.int/pub/published_pct_sequences

XX for detecting, diagnosing and treating disorders such as angioedema,
XX cancer, viral, bacterial or fungal infection, cardiovascular and
XX autoimmune diseases.
XX
XX Disclosure; Page 859; 977pp; English.
XX
XX The invention relates to an isolated nucleic acid from a human gene
XX encoding aminopeptidase P (XPNEP2), bradykinin receptor B1 (BDKRB1),
XX tachykinin receptor B1 (TACR1), C1 esterase inhibitor (CINH), kallikrein
XX 1 (KLK1), bradykinin receptor B2 (BDKRB2), angiotensin converting enzyme
XX 2 (ACE2) or protease inhibitor 4 (PI4), comprising at least one
XX polymorphic position. Also included are (1) a probe that hybridises to a
XX polymorphic position as provided in the detailed summary of single
XX nucleotide polymorphisms comprising additional 5' and 3' flanking genomic
XX sequence; (2) analysing (M1) at least one nucleic acid sample comprising
XX obtaining the sample from one or more individuals and determining the
XX nucleic acid sequence at one or more polymorphic positions in a gene
XX encoding a protein selected from the group above; (3) constructing (M2)
XX haplotypes using the genes comprising grouping at least two nucleic acids
XX; (4) identifying (M3) an individual at risk of developing a disorder
XX upon administration of an ACE inhibitor and/or vasoconstrictor inhibitor
XX using the polymorphic data; (5) a library of nucleic acids, each of which
XX comprises one or more polymorphic positions within a gene encoding a
XX human protein selected from the group above; and (6) genotyping (M4) an
XX individual comprising obtaining a nucleic acid sample, determining the
XX nucleotide present in at least one polymorphic position, and comparing at
XX least one position with a known data set. The genes, (M1, M2, M3 and M4)
XX and compositions are useful for detecting, diagnosing, treating,
XX preventing various disorders such as angioedema and diseases which
XX involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's
XX disease, trachomas, and cardiovascular diseases like angina pectoris,
XX hypertension, heart failure, myocardial infarction, ventricular
XX artery disease, arteriosclerosis and/or atherosclerosis, and
XX hyperaerisativity reactions, sepsis, autoimmune diseases, inflammatory
XX arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic
XX obstructive pulmonary disease (COPD) and enterocolitis (many other
XX diseases and disorders are listed in the specification). The
XX polymorphisms are also useful for chromosome identification. Antibodies
XX against the proteins may be utilised for immunophenotyping of cell lines
XX and biological samples. The present sequence represents or contains the
XX region surrounding a single-nucleotide polymorphism in one of the genes
XX encoding one of the proteins listed above

XX
XX Claim 1; Page 119; 130pp; English.
XX
XX Sequences AAZ77573-Z79709 represent SAGE (serial analysis of gene
XX expression) tags used to identify mRNA transcripts encoding
XX immunostimulatory cofactor proteins which are preferentially or
XX differentially expressed in monocyte-derived dendritic cells compared
XX with monocytes. Some of the transcripts correspond to known genes or ESTs
XX (expressed sequence tags) which were previously unknown to be
XX preferentially or differentially expressed in dendritic cells, while
XX other transcripts correspond to novel genes. Antigen-presenting cell

```

```

CC (APC)-associated costimulatory factors play an important role in the
CC activation of the cytotoxic immune response, particularly against tumour
CC cells. Tumour antigen presentation via the MHC (major histocompatibility
CC complex) and subsequent recognition by T-cell receptors is alone
CC insufficient to activate a robust cytotoxic immune response that can lyse
CC the tumour cells, immunostimulatory cofactors also being required for
CC efficient activation of cytotoxic T-lymphocytes (CTLs). Nucleic acid
CC sequences identified using the SAGE tags have several potential uses.
CC They may be used in vaccines to induce an immune response, particularly
CC against a tumour antigen; to modulate the genotype of an APC; to screen
CC for agents that modulate expression of differentially expressed genes in
CC an APC; and as hybridisation probes/amplification primers for the
CC diagnosis, prognosis and monitoring of diseases related to abnormal
CC expression of these genes. Detection of the dendritic cell differentially
CC expressed genes, or of their encoded proteins, can be used to identify
CC cells as belonging to the monocyte lineage. Cells containing these genes
CC can be used in active immunotherapy (or to stimulate production of a
CC population of antigen-specific effector cells) and vectors containing
CC them are used in gene therapy. Co-administration of tumour antigens and
CC APC-associated costimulatory factors ensures adequate antigen
CC presentation to endogenous APCs and upregulates the APCs for the
CC presentation of co-stimulatory signals, migration to T cell-rich sites,
CC secretion of T cell growth factors and secretion of chemokines for
CC recruitment of immune effector cells

CC tissue (i.e. are downregulated in the primary or non-metastatic breast tumour
CC transcripts can be used for diagnosis, prognosis, monitoring and
CC treatment of breast cancer, particularly where metastatic. Diagnosis is
CC by standard immunoassays or hybridisation/amplification reactions.
CC Compounds that modulate expression of the transcripts are potentially
CC useful for treatment of (metastatic) breast cancer, while promoters from
CC e.g. therapeutic genes (also ribozymes or antisense sequences),
CC particularly an antigen-encoding sequence for use in gene or cell-based
CC vaccines. Polypeptides encoded by the transcripts are also useful in
CC vaccines for diagnosing breast cancer and for raising specific
CC antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic
CC agents. Host cells that produce the polypeptides can be used to expand
CC and isolate populations of educated, antigen-specific immune effector
CC cells, e.g. cytotoxic T lymphocytes, and these used for adoptive
CC immunotherapy

PT Groups of genes expressed in human dendritic cells at a greater or lesser
 PT extent than in monocytes for investigation and diagnosis of autoimmune
 PT disease and tumors.

XX Claim 19; Page 15; 95pp; Japanese.

XX The present invention describes a group of genes consisting of 100 genes
 CC which are highly expressed in human dendritic cells; a group of genes
 CC which are expressed at a higher frequency in human dendritic cells than
 CC in human monocytes; and a group of genes which are expressed at lower
 CC frequency in human dendritic cells than in human monocytes. Each group of
 CC genes are characterized in that cDNAs of these genes respectively have
 CC the base sequences of SEQ ID NO:1 to 100 (AAC73914 to AAC74013), SEQ ID
 CC NO:101 to 200 (AAC74014 to AAC74113) and SEQ ID NO:201 to 300 (AAC74114
 CC to AAC74213), each is continuous with the base sequence 5'-CATG-3',
 CC located most closely to the poly-A region. The sequences can be used for
 CC the investigation of the role and mechanism of the involvement of
 CC dendritic cells in the immune system and for the study and diagnosis of
 CC diseases in which dendritic cells play a significant role, e.g. cancers
 CC and autoimmune diseases

XX
XX   Performing differential display of prokaryotic mRNA by a RT (reverse
PT   transcriptase)/RAP (random arbitrary-primed) PCR based technique comprises
PT   using a unique combination of random primers in a single amplification
PT   step.
XX
XX   Claim 1; Page 19; 63pp; English.
XX
XX   The present invention is concerned with a method of differential display
CC   of prokaryotic mRNA by RT-PCR. This involves the amplification of the
CC   mRNA once, and the further amplification of the cDNA, rather than the
CC   repeated amplification of the mRNA sample. It also eliminates the need
CC   for sequencing gels using Northern and total RNA dot blots to confirm
CC   differentially displayed transcript levels. The primers AAA99849-A99868
CC   were used in a reverse transcription PCR amplification, and primers
CC   AAA99869-A99876 were used to prepare probes for a Northern blot analysis.
CC   The method can be used to rapidly identify genes with increased or
CC   decreased transcription following environmental stimuli, in bioprocess
CC   fermentations, and to analyse gene regulation. (Updated on 06-AUG-2003 to
CC   correct OS field.)

XX Yeast Gene coding sequences comprising NORF genes with serial analysis of
PT gene expression (SAGE) tags, useful for studying, monitoring and
PT affecting phases of the cell cycle.
XX
XX Example; Page 193; 419pp; English.
XX
XX The present invention describes an isolated DNA molecule comprising a
CC coding sequence of a yeast gene selected from a group of 745 NORF (not
CC previously assigned open reading frame; or nonannotated ORF) genes
CC comprising a SAGE (serial analysis of gene expression) tag. Also
CC described are: (1) a method (M1) of using NORF genes to affect the cell
CC cycle comprising administering a NORF gene whose expression varies by at
CC least 10% between any two phases of the cell cycle selected from log
CC phase, S phase and G2/M; (2) a method (M2) for screening candidate
CC antifungal drugs comprising: (a) contacting a test substance with a yeast
CC cell; and (b) monitoring expression of a NORF gene whose expression
CC varies as in M1, where a test substance which modifies the expression of
CC the yeast gene is a candidate antifungal drug; (3) a method (M3) for
CC identifying human genes which are involved in cell cycle progression
CC comprising contacting human DNA with a probe which comprises at least 10
CC contiguous nucleotides of a NORF gene whose expression varies as in M1;
CC and (4) a method (M4) for identifying a candidate drug as a member of a
CC class of drugs having a characteristic effect on gene expression in a
CC yeast cell comprising contacting a yeast cell with a candidate drug and
CC monitoring expression in the yeast cell of at least 1 NORF gene whose
CC expression is affected by the class of drugs. The NORF genes may be used
CC to study, monitor and affect phases of the cell cycle, the differentially
CC expressed genes may be used as markers of phases of the cell cycle. The
CC methods may be used to identify candidate drugs which affect the cell
CC cycle and for identification of antifungal drugs. AAF3268 to AAF4064
CC represent SAGE tags used in the exemplification of the present invention.
CC AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE
CC method, in the exemplification of the present invention

XX
XX Generating longer cDNA fragments from serial analysis of gene expression,
XX SAGE tags for gene identification, using SAGE tag sequence as sense
XX primer, single-base anchored oligo-dT as antisense primer for
XX amplification.
XX
XX Example 2; Page 38; 62pp; English.
XX
XX AAF42227-44 represent SAGE (serial analysis of gene expression) tags,
XX isolated from human colon tissue. The specification describes a method
XX for characterizing SAGE tag fragments. The method comprises obtaining RNA
XX from the tissue used in generating the SAGE tag, generating cDNA
XX fragments that correspond to the SAGE tag from the RNA by amplifying
XX using primers comprising a SAGE tag sequence as a sense primer and a
XX single-base anchored oligonucleotide primer as an antisense primer and a
XX analysing the cDNA fragments. The method is useful for converting a SAGE
XX tag sequence into a longer cDNA fragment containing up to several 100
XX bases from the SAGE tag to the 3' end of the corresponding cDNA, for gene
XX identification. The high-throughput generation of longer SAGE tags for
XX gene identification (GLGI) procedure has several applications, including
XX wider application of SAGE technique for quantitative analysis of global
XX gene expression and to identify the 3' DNA sequence from any exon within
XX a gene. The combined application of SAGE/GLGI can be applied to define
XX the 3' boundary of expressed genes in the genomic sequences in humans and
XX in other eukaryotic genomes

XX
XX New zinc finger protein that binds to target site, useful in studying
XX gene function and for human therapeutics and plant engineering, comprises
XX first, second and third zinc fingers, ordered from N- to C-terminus.
XX
XX Example 1; Page 45; 81pp; English.
XX
XX The present invention describes a zinc finger protein (I) that binds to a
XX target site, comprising a first (F1), a second (F2), and a third (F3)
XX zinc finger, ordered F1, F2, F3 from N-terminus to C-terminus, where the
XX target site comprises, in 3'-5' direction, a first (S1), a second (S2),
XX and a third (S3) target subsite. Also described are: (1) a polypeptide
XX (II) comprising (I); (2) a polynucleotide (III) encoding (I) or (II); and
XX (3) designing (M) (I) involves selecting the F1 zinc finger such that it
XX binds to the S1 target subsite, selecting the F2 zinc finger such that it
XX binds to the S2 target subsite, and selecting the F3 zinc finger such
XX that it binds to the S3 target subsite, thus designing (I) that binds to
XX a target site. (I) is useful for recognition of triplet target subsites
XX having the nucleotide G in the 5'-most position of the subsite. (I) is
XX useful in studying gene function, and for human therapeutics and plant
XX engineering. (I), (II) or (III) is useful in therapeutic methods to
XX modulate the expression of a target region within a subject, in
XX diagnostic methods for sequence specific detection of target nucleic acid
XX in a sample, and in assays to determine the phenotype and function of
XX gene expression. (I) has improved affinity and specificity for their
XX target sequences, as well as enhanced biological activity. ABQ71213 to
XX ABQ72214 and ABP48191 to ABP51230 represent DNA target sequences and zinc
XX finger peptides which are given in the exemplification of the present
XX invention

XX Vogelstein B, Kinzler KW, Saha S, Bardelli A;
XX WPI; 2003-393457/37.
XX Identifying regions of neoplastic growth in a human body, useful for
XX detecting or predicting metastasis, comprises administering to the human
XX body an antibody or peptide that specifically binds to a protein marker
XX of neoplastic growth.
XX Example 2; Page 21; 42pp; English.
XX The invention relates to methods for identifying regions of neoplastic
XX growth in a human patient, especially for detecting or predicting
XX metastasis. The methods involve determining whether a neoplastic growth
XX marker protein is overexpressed, either by the use of an antibody
XX specific for the protein, or by the use of PCR or hybridisation to detect
XX nucleic acids encoding the marker proteins. A set of neoplastic growth
XX markers are disclosed (SAGE (serial analysis of gene expression) tags for
XX these are given in ADA26759-ADA26796), with protein tyrosine phosphatase
XX type IVA member 3 (also known as PRL-3) being a preferred neoplastic
XX growth marker. The neoplastic growth markers are specifically expressed
XX at a higher level in metastatic cancers, compared with advanced and early
XX stage cancers and normal cells from which the cancer is derived.
XX Overexpression of the neoplastic growth markers is taken as an indication
XX that the tissue has a propensity to metastasise. The invention also
XX encompasses methods for treating a patient with an advanced or metastatic
XX cancer, and for identifying candidate drugs for treating advanced or
XX metastatic cancers. The methods of the invention are useful for
XX identifying regions of neoplastic growth, for detecting or predicting
XX metastasis, or identifying candidate drugs for treating advanced or
XX metastatic cancers. The invention is particularly applicable to
XX gastrointestinal, prostate, breast or colorectal cancers. Antibodies
XX which bind to the neoplastic growth marker proteins are additionally
XX useful for diagnostic imaging and for targeting cytotoxic or
XX chemotherapeutic drugs. The present sequence represents a human
XX neoplastic growth marker SAGE tag identified in an example of the
XX invention.

XX Detecting colorectal cancer in a subject, involves detecting macrophage
XX inhibitory cytokine or renal dipeptidase or their mRNA in feces or blood
XX of the subject.
XX Disclosure; Page 25; 59pp; English.
XX The invention relates to detecting CC (colorectal cancer e.g. colorectal
XX adenoma), comprising: (a) detecting macrophage inhibitory cytokine (MIC)
XX or renal dipeptidase (RDP) in faeces or blood of a subject and comparing
XX amount of MIC or RDP detected to that in normal subjects, where an
XX elevated amount of MIC or RDP in the subject is an indicator of CC in
XX subject; (b) isolating mRNA sample from faeces of a subject, detecting
XX MIC or RDP mRNA in the mRNA sample, and comparing amount of MIC or RDP
XX mRNA detected to that in normal subjects, where an elevated amount of MIC
XX or RDP mRNA in the subject is an indicator of CC in subject; (c)
XX isolating epithelial cells from blood of a subject, isolating an mRNA
XX sample from faeces of a subject or epithelial cells, detecting MIC or RDP
XX mRNA in the mRNA sample, and comparing the amount of MIC or RDP mRNA in
XX the mRNA sample to amounts of MIC or RDP mRNA in normal subjects, where
XX an elevated amount of MIC or RDP mRNA in the mRNA sample is an indicative
XX of CC in the subject; (d) contacting blood or faeces of a subject, with
XX an RDP substrate, detecting activity of RDP in the blood or faeces by
XX detection of increased reaction product or decreased RDP substrate, and
XX comparing the amount of activity of RDP in blood or faeces of the subject
XX to that in normal subjects, where an elevated amount of activity of RDP
XX in the blood or faeces of the subject is an indicator of CC in the
XX subject; (e) administering to a subject an antibody which specifically
XX binds to RDP or an inhibitor of RDP, where the antibody or inhibitor is
XX labeled with a moiety which is detectable from outside of the subject and
XX detecting the moiety in the subject from outside of the subject, where an
XX area of localisation of the moiety within the subject but outside the
XX proximal tubules of the kidney identifies CC; or (f) administering to a
XX subject a substrate for RDP, the substrate being labeled with a
XX detectable moiety, isolating faeces or blood from the subject, and
XX detecting in the faeces or blood RDP reaction product or RDP substrate
XX with the detectable moiety, where increased product or decreased
XX substrate in the faeces or blood indicates CC in the subject. The methods
XX are useful for detecting colorectal cancer in a subject. The present
XX sequence is a DNA tag derived from a human transcript whose expression is
XX elevated in colorectal cancer or colorectal adenoma

XX
XX A new method for detecting specific nucleic acid sequences in a sample
XX involves amplifying the nucleic acid sample by PCR and then cleaving the
XX amplified products with uracil DNA glycosylase (UDG), the resulting DNA
XX fragments are detected using reverse blot hybridisation techniques. The
```

CC method can be used to distinguish between two different sequences, for
 CC example for the detection of a DNA fragment carrying a mutation. The
 CC method is useful for detecting the presence or absence of a nucleic acid
 CC sequence containing a polymorphic restriction site associated with a
 CC disease such as cystic fibrosis disease, and may be used for detecting
 CC infectious diseases. Genetic disorders such as sickle cell anemia,
 CC cystic fibrosis, alpha or beta thalassemia, muscular dystrophy, and Tay-
 CC Sachs disease may also be detected using the method. Oncogenes such as
 CC RAS may also be detected using the method, for the diagnosis of certain
 CC cancers. The present sequence represents a fragment of the K-ras gene
 CC created by UNG cleavage. This sequence is used in an example of the
 CC invention and contains the position of a mutation site in K-ras SW480.
 CC This fragment and the corresponding mutant containing fragment (AAA72649)
 CC can be used to produce probes specifically to identify the mutation,
 CC which can then be used in the method of the invention

XX Determining presence of a tumor cell or angiogenesis, and the

PT effectiveness of treatment, by detecting the presence of marker genes is

PT useful to detect and monitor treatment of Kaposi's Sarcoma.

XX Claim 12; Page 9; 38pp; English.

PS The present invention describes a method for determining if an individual
 CC has a tumour cell or site of angiogenesis, or if a treatment is effective
 CC in changing angiogenesis or changing a status of a set of target cells,
 CC comprising determining if a sample of the subject has an expression
 CC product of at least one marker gene. Also described is a compound capable
 CC of altering the expression or activity of Keratin 14, TIE 1, Salivohesin
 CC or Siglec in a cell. Peripheral blood mononuclear cell (PBMC)-expressed
 CC Keratin 14, TIE 1, Salivohesin or Siglec, and kits containing them from
 CC the present invention can be used in a diagnostic method, particularly as
 CC an indicator of angiogenesis or to determine presence of a tumour cell.
 CC The method of the invention is suitable to determine within a few days if
 CC a certain treatment against Kaposi's Sarcoma is successful. ABQ81851 to
 CC ABQ82006 represent nucleotide sequence used in the exemplification of the
 CC present invention

XX WPI; 1997-045827/05.

XX Detection of gene variation, determined by UV absorbance - using a new

XX low cost DNA variation detector.

XX Example; Fig 4; 6pp; Japanese.

XX Codons 1 to 21 of K-ras exon 1 contain a variation hot spot, which can be
 CC detected using the method of the invention. The wild type (AAT47112) and
 CC variant (AAT47113) K-ras sequences are non-specifically amplified using
 CC the primers AAT47114/15, which are complementary to sequences at either
 CC side of the hot spot. An asymmetric PCR is carried out with the centrally
 CC placed hot spot of the K-ras DNA placed in between, using the primers
 CC AAT47116-19 in the pairings AAT47116/18, AAT47117/19, AAT47116/19 and
 CC AAT47117/18. The resulting asymmetric PCR prods. are then annealed with
 CC oligonucleotides having sequences complementary to the base sequence of
 CC the wild type DNA. The resultant double stranded DNA is then heated, and
 CC the change in absorbance due to the rise in temp. analysed, to detect a
 CC variation in the DNA. The method determines variations in DNA sequences
 CC based on UV absorbance values, pref. using a novel low cost DNA variation

XX Detection of gene variation, determined by UV absorbance - using a new

XX low cost DNA variation detector.

XX Example; Fig 4; 6pp; Japanese.

XX Codons 1 to 21 of K-ras exon 1 contain a variation hot spot, which can be

XX detected using the method of the invention. The wild type (AAT47112) and

CC variant (AAT47113) K-ras sequences are non-specifically amplified using
CC the primers AAT47114/15, which are complementary to sequences at either
CC side of the hot spot. An asymmetric PCR is carried out with the centrally
CC placed hot spot of the K-ras DNA placed in between, using the primers
CC AAT47116-19 in the pairings AAT47116/18, AAT47117/19, AAT47116/19 and
CC AAT47117/18. The resulting asymmetric PCR prods. are then annealed with
CC oligonucleotides having sequences complementary to the base sequence of
CC the wild type DNA. The resultant doubled stranded DNA is then heated, and
CC the change in absorbance due to the rise in temp. analysed, to detect a
CC variation in the DNA. The method determines variations in DNA sequences
CC based on UV absorbance values, pref. using a novel low cost DNA variation
CC detector

XX CC Differential screening of gene expression by reverse transcription
XX CC polymerase chain reaction - uses random priming with primers selected for
XX CC high efficiency and selectivity by computer screening of database(s).
XX CC Claim 9; Page 24; 37pp; English.
XX CC The invention provides a method for the differential screening of gene
XX CC expression by random primed reverse transcription PCR (RT-PCR). The
XX CC primer sequences are generated by stimulating PCR reactions on non-
XX CC redundant mammalian nucleotide sequence databank entries containing at
XX CC least 1,000 bp of coding region. The primers selected, such as the
XX CC present one, had to meet various criteria such as having an efficiency
XX CC index between 2-10, having a selectivity index higher than 1, being 12 bp
XX CC long i.e. 8 C or G and 4 T or A, and each primer differed from the others
XX CC in at least 5 of the 8 bases at the 3'-end. The invention claims the
XX CC selected primers make it possible to use internally primed, PCR-based RNA
XX CC fingerprinting for simple, exhaustive and systematic analysis of
XX CC differential gene expression as an advantageous alternative to
XX CC differential display. The method can also be useful for isolating new
XX CC coding sequences and to compare known and new genes

CC The invention relates to an apparatus for carrying out sample preparation
CC and multiplex detection of panels of target nucleic acids and antigens in
CC a sample, comprising a sample preparation zone, several three dimensional
CC capture probe platforms for capturing specific classes of target
CC molecules and spacer elements for separating the sets of three
CC dimensional capture probe platforms. The apparatus is useful for carrying
CC out multiplex detection of panels of target nucleic acids and antigens in
CC a sample, by providing a sample containing target nucleic acids and/or
CC antigens of interest, treating the sample with a sample buffer to form a
CC pre-processed sample, passing the pre-processes sample over the
CC apparatus, capturing the target nucleic acids and antigens by capture
CC probes of the apparatus, reacting a label with a signal probe, the signal
CC probe having specificity for at least one other signal probe that is
CC specific for the target and detecting the reacted level. Sequences

XX
XX Sequencing an unknown DNA molecule for the polymerase chain reaction and
XX other primer processes comprises primer walking of octamer
XX oligonucleotides.
XX
XX Example 8; Col 75-76; 161pp; English.
XX
XX This invention describes a novel method for sequencing an unknown DNA
XX molecule which comprises selecting a library primer from an octamer
XX oligonucleotide library consisting of 48 8-bp sequences and corresponding
XX complementary sequences, where the library primer is complementary to a
XX known sequence adjacent to the unknown sequence or is complementary to a
XX sequence in a known extension product. The method is useful for DNA
XX nucleotide sequencing, in PCR, and in other processes which make use of
XX primers. The octamers are used to identify coding sequences. Primer
XX walking using the octamer libraries is advantageous over other sequencing
XX methods because it does not require multiple cloning steps nor subsequent
XX template preparations, and it is a directed and methodical approach.
XX AAA80688-A81253 represent the octamer primers used in the primer walking

XX New zinc finger protein that binds to target site, useful in studying
XX gene function and for human therapeutics and plant engineering, comprises
XX first, second and third zinc fingers, ordered from N- to C-terminus.
XX
XX Example 1; Page 60; 81pp; English.
XX
XX The present invention describes a zinc finger protein (I) that binds to a
XX target site, comprising a first (F1), a second (F2), and a third (F3)
XX zinc finger, ordered F1, F2, F3 from N-terminus to C-terminus, where the
XX target site comprises, in 3'-5' direction, a first (S1), a second (S2),
XX and a third (S3) target subsite. Also described are: (1) a polypeptide
XX (II) comprising (I); (2) a polynucleotide (III) encoding (I) or (II); and
XX (3) designing (M) (I) involves selecting the F1 zinc finger such that it
XX binds to the S1 target subsite, selecting the F2 zinc finger such that it
XX binds to the S2 target subsite, and selecting the F3 zinc finger such
XX that it binds to the S3 target subsite, thus designing (I) that binds to
XX a target site. (I) is useful for recognition of triplet target subsites
XX having the nucleotide G in the 5'-most position of the subsite. (I) is
XX useful in studying gene function, and for human therapeutics and plant
XX engineering. (I), (II) or (III) is useful in therapeutic methods to
XX modulate the expression of a target region within a subject, in
XX diagnostic methods for sequence specific detection of target nucleic acid
XX in a sample, and in assays to determine the phenotype and function of
XX gene expression. (I) has improved affinity and specificity for their
XX target sequences, as well as enhanced biological activity. ABQ71213 to

CC a target site. (I) is useful for recognition of triplet target subsites
CC having the nucleotide G in the 5'-most position of the subsite. (I) is
CC useful in studying gene function, and for human therapeutics and plant
CC engineering. (I), (II) or (III) is useful in therapeutic methods to
CC modulate the expression of a target region within a subject, in
CC diagnostic methods for sequence specific detection of target nucleic acid
CC in a sample, and in assays to determine the phenotype and function of
CC gene expression. (I) has improved affinity and specificity for their
CC target sequences, as well as enhanced biological activity. ABQ71213 to
CC ABQ72214 and ABP48191 to ABP51230 represent DNA target sequences and zinc
CC finger peptides which are given in the exemplification of the present
CC invention

XX
XX Isolated polynucleotides differentially expressed in antigen-presenting
XX cells, useful in gene vaccines against cancer.
XX
XX Claim 1; Page 92; 130pp; English.
XX
XX Sequences AAZ77573-279709 represent SAGE (serial analysis of gene
XX expression) tags used to identify mRNA transcripts encoding or
XX immunostimulatory cofactor proteins which are preferentially or
XX differentially expressed in monocyte-derived dendritic cells compared
XX with monocytes. Some of the transcripts correspond to known genes or ESTs
XX (expressed sequence tags) which were previously unknown to be
XX preferentially or differentially expressed in dendritic cells, while
XX other transcripts correspond to novel genes. Antigen-presenting cell
XX (APC)-associated costimulatory factors play an important role in the
XX activation of the cytotoxic immune response, particularly against tumour
XX cells. Tumour antigen presentation via the MHC (major histocompatibility
XX complex) and subsequent recognition by T-cell receptors is alone
XX insufficient to activate a robust cytotoxic immune response that can lyse
XX the tumour cells, immunostimulatory cofactors also being required for
XX efficient activation of cytotoxic T-lymphocytes (CTLs). Nucleic acid
XX sequences identified using the SAGE tags have several potential uses.
XX They may be used in vaccines to induce an immune response, particularly
XX against a tumour antigen; to modulate the genotype of an APC; to screen
XX for agents that modulate expression of differentially expressed genes in
XX an APC; and as hybridisation probes/amplification primers for the
XX diagnosis, prognosis and monitoring of diseases related to abnormal
XX expression of these genes. Detection of the dendritic cell differentially
XX expressed genes, or of their encoded proteins, can be used to identify
XX cells as belonging to the monocyte lineage. Cells containing these genes
XX can be used in active immunotherapy (or to stimulate production of a
XX population of antigen-specific effector cells) and vectors containing
XX APC-associated costimulatory factors ensures adequate antigen
XX presentation to endogenous APCs and upregulates the APCs for the
XX presentation of co-stimulatory signals, migration to T cell-rich sites,
XX secretion of T cell growth factors and secretion of chemokines for
XX recruitment of immune effector cells

 XX Isolated polynucleotides differentially expressed between metastatic and
 PT non-metastatic breast cancer cells, useful for diagnosis, prevention and
 PT treatment of cancer.
 XX Claim 1; Page 111; 219pp; English.
 XX AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts
 CC that are preferentially transcribed in the metastatic breast tumour
 CC tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942
 CC to AAZ86677 represent tags corresponding to distinct transcripts that are
 CC preferentially transcribed in the primary or non-metastatic breast tumour
 CC tissue (i.e. are downregulated in metastatic breast tumour cells). These
 CC transcripts can be used for diagnosis, prognosis, monitoring and
 CC treatment of breast cancer, particularly where metastatic. Diagnosis is
 CC by standard immunoassays or hybridisation/amplification reactions.
 CC Compounds that modulate expression of the transcripts are potentially
 CC useful for treatment of (metastatic) breast cancer, while promoters from
 CC the transcripts are used to direct expression, in selected cell types, of
 CC e.g. therapeutic genes (also ribozymes or antisense sequences),
 CC particularly an antigen-encoding sequence for use in gene or cell-based
 CC vaccines. Polypeptides encoded by the transcripts are also useful in
 CC vaccines; for diagnosing breast cancer and for raising specific
 CC antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic
 CC agents. Host cells that produce the polypeptides can be used to expand
 CC and isolate populations of educated, antigen-specific immune effector
 CC cells, e.g. cytotoxic T lymphocytes, and these used for adoptive
 CC immunotherapy

 XX Groups of genes expressed in human dendritic cells at a greater or lesser
 PT extent than in monocytes for investigation and diagnosis of autoimmune
 PT disease and tumors.
 XX Claim 19; Page 15; 95pp; Japanese.
 XX The present invention describes a group of genes consisting of 100 genes
 CC which are highly expressed in human dendritic cells; a group of genes
 CC which are expressed at a higher frequency in human dendritic cells than
 CC in human monocytes; and a group of genes which are expressed at lower
 CC frequency in human dendritic cells than in human monocytes. Each group of
 CC genes are characterised in that cDNAs of these genes respectively have
 CC the base sequences of SEQ ID NO:1 to 100 (AAC73914 to AAC74013), SEQ ID
 CC NO:101 to 200 (AAC74014 to AAC74113) and SEQ ID NO:201 to 300 (AAC74114
 CC to AAC74213), each is continuous with the base sequence 5'-CATG-3',
 CC located most closely to the poly-A region. The sequences can be used for
 CC the investigation of the role and mechanism of the involvement of
 CC dendritic cells in the immune system and for the study and diagnosis of
 CC diseases in which dendritic cells play a significant role, e.g. cancers
 CC and autoimmune diseases

XX
XX Yeast gene coding sequences comprising NORF genes with arial analysis of
XX gene expression (SAGE) tags, useful for studying, monitoring and
XX affecting phases of the cell cycle.
XX
XX Example; Page 374; 419pp; English.
XX
XX The present invention describes an isolated DNA molecule comprising a
XX coding sequence of a yeast gene selected from a group of 745 NORF (not
XX previously assigned open reading frame; or nonannotated ORF) genes
XX comprising a SAGE (serial analysis of gene expression) tag. Also
XX described are: (1) a method (M1) of using NORF genes to affect the cell
XX cycle comprising administering a NORF gene whose expression varies by at
XX least 10% between any two phases of the cell cycle selected from log
XX phase, S phase and G2/M; (2) a method (M2) for screening candidate
XX antifungal drugs comprising: (a) contacting a test substance with a yeast
XX cell; and (b) monitoring expression of a NORF gene whose expression
XX varies as in M1, where a test substance which modifies the expression of
XX the yeast gene is a candidate antifungal drug; (3) a method (M3) for
XX identifying human genes which are involved in cell cycle progression
XX comprising contacting human DNA with a probe which comprises at least 10
XX contiguous nucleotides of a NORF gene whose expression varies as in M1;
XX and (4) a method (M4) for identifying a candidate drug as a member of a
XX class of drugs having a characteristic effect on gene expression in a
XX yeast cell comprising contacting a yeast cell with a candidate drug and
XX monitoring expression in the yeast cell of at least 1 NORF gene whose
XX expression is affected by the class of drugs. The NORF genes may be used
XX to study, monitor and affect phases of the cell cycle, the differentially
XX expressed genes may be used as markers of phases of the cell cycle. The
XX methods may be used to identify candidate drugs which affect the cell
XX cycle and for identification of antifungal drugs. AAF33268 to AAF44064
XX represent SAGE tags used in the exemplification of the present invention.
XX AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE
XX method, in the exemplification of the present invention

 XX New nucleotide polymorphisms in the human diphtheria toxin receptor,
 PT heparin-binding epidermal growth factor-like growth factor (DTR) gene,
 PT useful for screening or expressing proteins for treating diseases related
 PT to DTR activity.
 XX Claim 18; Page 12; 66pp; English.
 XX The present invention relates to an isolated polynucleotide, comprising
 CC polymorphisms in the human diphtheria toxin receptor, heparin-binding
 CC epidermal growth factor-like growth factor (DTR) gene. DTR gene is
 CC located on chromosome 5q23. The polynucleotide comprising polymorphisms
 CC in the DTR gene is useful in studying the expression and function of DTR,
 CC and in expressing DTR protein for use in screening candidate drugs to
 CC treat diseases related to DTR activity. The methods and haplotypes are
 CC useful in improving the efficiency and output of several steps in the
 CC drug discovery and development process, including target validation,
 CC identifying lead compounds, and early phase clinical trials. The kit and
 CC method are useful for determining if an individual has one of the
 CC haplotypes or haplotype pairs. The transgenic animals are useful for
 CC studying expression of the DTR isogenes in vivo, for in vivo screening
 CC and testing of drugs targeted against DTR protein, and for testing the
 CC efficacy of therapeutic agents and compounds for tumour growth, smooth
 CC muscle hyperplasia or atherosclerosis in a biological system. The present
 CC sequence is a primer to detect polymorphisms in human DTR gene

 XX Genotyping a human UDP glycosyltransferase 1 gene of an individual for
 PT determining the haplotype of an individual, involves determining the
 PT identity of a nucleotide pair at specific polymorphic sites for two
 PT copies of the gene.
 XX Claim 18; Page 14; 81pp; English.
 XX The invention relates to genotyping a human UDP glycosyltransferase
 CC (UGT1A1) gene of an individual, involving determining for the two copies
 CC of the UGT1A1 gene present in the individual, the identity of the
 CC nucleotide pair at one or more polymorphic sites. The new method is
 CC useful for determining whether an individual has a haplotype or haplotype
 CC pairs, given in the specification. It is useful for improving the
 CC efficacy and reliability of several steps in the discovery and
 CC development of drugs for treating diseases associated with UGT1A1
 CC activity, e.g., Gilbert's syndrome and Crigler-Najjar syndrome, to
 CC validate UGT1A1 as a candidate agent for treating a specific condition or
 CC disease predicted to be associated with UGT1A1 activity, and in the
 CC design of clinical trials of candidate drugs for treating a specific
 CC condition or disease predicted to be associated with UGT1A1 activity. The
 CC method is useful to screen for compounds targeting UGT1A1 to treat a
 CC specific condition or disease associated with UGT1A1 activity. A nucleic
 CC acid (I) comprising a polymorphic variant of a reference sequence for the
 CC UGT1A1 gene or cDNA (II) or its fragment is useful in studying the
 CC expression and function of UGT1A1, and in expressing UGT1A1 protein for
 CC use in screening for candidate drugs to treat diseases related to UGT1A1
 CC activity. (I) or (II) is useful for therapeutic purposes. (II) or a
 CC recombinant organism comprising (II) is useful for studying expression of
 CC the UGT1A1 isogenes in vivo, for in vivo screening and testing of drugs
 CC targeted against UGT1A1 protein, and for testing the efficacy of
 CC therapeutic agents and compounds for Gilbert's syndrome and Crigler-
 CC Najjar syndrome, in a biological system. AAS99134-AAS99203 represent UDP
 CC glycosyltransferase 1 gene allele-specific oligonucleotides used in the
 CC method of the invention

PT New calmodulin-1 (CALM-1) isogene polymorphic variants, useful in
 PT expressing CALM1 protein for use in screening for candidate drugs to
 PT treat diseases related to CALM1 activity such as Alzheimer's disease.
 XX Claim 17; Page 14; 82pp; English.
 XX The invention relates to an isolated polynucleotide comprising a sequence
 CC selected from a polymorphic variant of calmodulin 1 (CALM1). The
 CC polymorphic variant comprises an CALM1 isogene defined by a haplotype
 CC selected from haplotypes 1-21 given in the specification. The
 CC polymorphisms are useful for studying the biological function of CALM1 as
 CC well as in identifying drugs targeting this protein for the treatment of
 CC a disorder related to its abnormal expression or function. The
 CC polymorphic variants may also be used in screening for compounds
 CC targeting CALM1 to treat a specific condition or disease predicted to be
 CC associated with CALM1 activity. Establishing CALM1 haplotype or haplotype
 CC pair of an individual is useful for improving the efficiency and
 CC reliability of several steps in the discovery and development of drugs
 CC for treating diseases associated with SCVA3 activity, e.g. Alzheimer's
 CC disease and diseases involving defects in calcium-dependent signal
 CC transduction. Haplotyping the CALM1 gene in an individual is also useful
 CC in the design of clinical trials of candidate drugs for treating a
 CC specific condition or disease predicted to be associated with CALM1
 CC activity. AAS95892-AAS96018 represent human CALM1 allele-specific
 CC oligonucleotides and PCR primers of the invention

 PT detect double stranded target sequences with no cross-reactivity between
 PT species.
 XX Claim 3; Col 15; 15pp; English.
 XX

CC The sequences given in AAT18103-11 are primers which may be used in the
 CC species-specific amplification of *M. kansasii* DNA. These primers bind to
 CC a fragment, bases 51-220, of the clone p6123. p6123 is a cloned probe
 CC which hybridises to all *M. kansasii* strains, including the subgroup which
 CC is negative to binding with the probe pMK1-9 (M.Yang et al. 1993. J.
 CC Clin. Microbid. 31, 2769-2772). These primers are pref. used in strand
 CC displacement amplification (SDA). These primers showed a positive
 CC reaction with 74 *M. kansasii* isolates tested, but did not cross react
 CC with any other *Mycobacterium* species. In addition, these primers did not
 CC cross-react with *Nocardia* asteroides or *Rhodococcus* rhodochrous. This
 CC primer binds around bases 93-103 of the p6123 fragment

XX Nucleic acid multimer template - for generating electrophoretic size
 PT markers of specific size.
 PT
 XX Disclosure; Col 25-26; 20pp; English.
 PS
 XX AAV61914-V61933 are sequences used a method resulting in the production
 CC of a nucleic acid multimer template for generating a size marker. The
 CC method is used to make molecular weight markers for use in gel
 CC electrophoresis (kits provided), especially in the high MW range, e.g.
 CC >500 bp. It can also be used to create radiolabelled RNA markers, which
 CC are currently not available. The method allows the construction of size
 CC markers of specific, predetermined size. Current markers are constructed
 CC from digestion of DNA e.g. lambda DNA, and their sizes depend on
 CC restriction sites in the DNA. Additionally, DNA does not migrate linearly
 CC in agarose, requiring extrapolation of sizes if a product falls between 3
 CC markers. The method allows construction of a marker of exact length to a
 CC desired product

XX Determining increased risk for thrombosis by determining prothrombin
 PT level, or by detecting the presence or absence of genetic mutation
 PT correlated with elevated prothrombin levels.
 PT
 XX Example 2; Col 11-12; 1lpp; English.

XX This invention describes a novel method for determining an increased risk
 CC for thrombosis in an individual by determining the prothrombin level, or
 CC by detecting the presence or absence of a genetic mutation correlated
 CC with elevated prothrombin levels in individuals with the mutation, and
 CC where an increased prothrombin level indicates increased risk for
 CC thrombosis. INDEPENDENT CLAIMS are also included for the following: (1) a
 CC kit for determining whether an individual is at an increased risk for
 CC thrombosis comprising at least one primer which specifically hybridizes
 CC adjacent to the region of the prothrombin gene that contains a G to A
 CC mutation at position 20210, and suitable amplification reagents; and (2)
 CC an isolated polynucleotide comprising a mutated prothrombin gene, in
 CC which G at position 20210 is replaced by A, or a fragment of the gene
 CC which includes the G to A transition mutation at position 20210. The
 CC method is also used for screening and diagnosis of thrombophilia,
 CC especially, hereditary thrombophilia. AAA11723-AAA11726 represent PCR
 CC primers used in the method of the invention

XX
XX Detection of chromosomal abnormalities - by subjecting patient sample
PT nucleic acids to a multiplex molecular amplification procedure using
PT primers specific for characteristic nucleic acid sequence.
XX
XX Claim 73; Page 67; 126pp; English.
XX
CC This sequence represents a primer used in the method of the invention for
CC the detection of the presence or absence of chromosomal abnormalities,
CC each abnormality being associated with a condition in a subject and each
CC being defined by at least one characteristic nucleic acid sequence. The
CC method comprises: (a) obtaining a sample of nucleic acids derived from a
CC subject which may harbour one of the chromosomal abnormalities; (b)
CC subjecting the sample to a multiplex molecular amplification (MMA)
CC procedure, where a number of the characteristic sequences, if present in
CC a sufficient amount, will be amplified; (c) retrieving the product (s)
CC from step (b), and detecting the presence and/or absence of an amplicon
CC characteristic of the abnormal sequences to detect the presence or
CC absence of corresponding chromosomal abnormalities; where the MMA
CC procedure comprises the use of at least 7 mutually distinct primers (MDP)
CC in one single reaction mixture, each of the primers defining an end of at
CC least one characteristic nucleic acid sequence, and where at least one of
CC the primers defines the first end of at least two characteristic nucleic
CC acid sequences, the characteristic nucleic acid sequences each being
CC determined in their opposite ends by MDP selected from the remainder of
CC the MDP. The methods can be used for detecting chromosomal abnormalities
CC associated with diseases including numerous leukaemia's, lymphoma's,
CC carcinoma's, adenocarcinoma's, sarcoma's, glioma's, neuroblastoma's,
CC medullablastoma, malignant melanoma, and malignant neoplastic conditions

PT designed to detect single-nucleotide polymorphisms and cytosine
PT methylation status.
XX Claim 1; SEQ ID NO 349633; 29pp + Sequence Listing; German.

CC This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) CC and cytosine methylation status in chemically pretreated genomic DNA. The CC oligonucleotides are used for diagnosis and/or prognosis of cancer and a CC range of diseases including immune system, gastrointestinal, respiratory, CC central nervous system, cardiovascular and metabolic disorders. The CC oligomers are also used for detecting cell type differentiation. ABC00010 CC -ABC9989, ABF00010-ABF9989, ABH00010-ABH9989 and ABI00010-ABI82073 CC represent the oligomers described in the invention. NOTE: The sequence CC data for this patent did not form part of the printed specification, but CC was obtained in electronic format from WIPO at CC ftp.wipo.int/pub/published_pct_sequences

PS Example 15; Col 42; 44pp; English.
XX
XX This sequence represents an oligonucleotide shown in the specification. A
XX crosslinked nucleic acid comprises: a 1st nucleotide (N1) located on a
XX 1st oligonucleotide (ON) strand; a 1st bond means (B1) located on a sugar
XX moiety of N1, a 2nd nucleotide (N2) located on a 2nd ON strand; a 2nd
XX bond means (B2) located on a sugar moiety of N2; and a covalent cross-
XX linkage (CCL) between B1 and B2; provided that at least one of B1 and B2
XX is located at a non-terminal nucleotide and further provided that CCL is
XX not between the 3' carbon of a sugar moiety of N1 and the 5' carbon of a
XX sugar moiety of N2; is not between the 3' carbon of a sugar group of N2
XX and the 5' carbon of a sugar gp. Of N1; and does not include a
XX nucleosidic base. The oligonucleotides can be used as RNA mimics that are
XX fixed in specific spatial conformations via crosslinking covalent bonds.
XX The covalently crosslinked ON's have the same sequence as known nuclease-
XX resistant mimics of binding receptors for nucleic acid binding proteins.

 XX
 PS Example 10; Col 39; 36pp; English.
 XX
 CC This sequence represents an oligonucleotide shown in the patent. The
 CC invention relates to a cross-linked nucleic acid, which comprises: (a) a
 CC first nucleotide located on a first oligonucleotide strand having a first
 CC bond site located on either a 2'- or 3'-OH of the sugar moiety; (b) a
 CC second nucleotide located on a second oligonucleotide strand having a
 CC second bond site located on either a 2'- or 3'-OH of the sugar moiety.
 CC The first strand is linked to the second strand via a non-phosphorus
 CC covalent cross-linkage between the first and second bond sites, where not
 CC both sites may be on a 3'-OH or a terminal nucleotide. The cross-linked
 CC nucleic acids include materials in which oligonucleotide strands are
 CC covalently cross-linked to themselves or to other strands. Such materials
 CC can be used, e.g., as RNA mimics which are fixed in specific spatial
 CC conformations. These materials may be used as therapeutic agents,
 CC research reagents and diagnostic agents. (Updated on 25-MAR-2003 to
 CC correct PR field.)

 XX New mammalian model for enhanced wound healing - useful for identifying
 PT enhanced wound healing genes.
 PT
 XX Claim 13; Page 72; 136pp; English.
 PS
 XX This invention describes a novel non-MRL healer mouse (M) having at least
 CC one quantitative trait locus selected from those given in the
 CC specification, exhibiting an enhanced healing response to a wound
 CC compared to mice (m) without the locus. The invention describes a novel
 CC method of identifying a gene involved in enhanced wound healing by
 CC identifying DNA microsatellite markers which can distinguish healer
 CC from non-healer mice and identifying microsatellite markers which
 CC segregate with enhanced wound healing in progeny of the mice, where a
 CC chromosomal locus containing at least one enhanced wound healing gene is
 CC identified. A method of treating a wound in a mammal is also disclosed.

CC method of identifying a gene involved in enhanced wound healing by
 CC identifying DNA microsatellite markers which can distinguish healer mice
 CC from non-healer mice and identifying microsatellite markers which
 CC segregate with enhanced wound healing in progeny of the mice, where a
 CC chromosomal locus containing at least one enhanced wound healing gene is
 CC identified. A method of treating a wound in a mammal is also disclosed.
 CC The new methods are useful for treating wounds, especially central and
 CC peripheral nerve wound. The methods of the invention are useful for
 CC restoring function after nerve injury in a mammal. (M) is useful as a
 CC mammalian model of enhanced wound healing, useful for identifying genes
 CC and gene products involved in enhanced wound healing, and to provide
 CC methods for wound healing. AAZ18691-Z19036 represent murine SAGE tags
 CC from C57BL/6 and MRL mice which are used to illustrate the method of the
 CC invention

 XX New mammalian model for enhanced wound healing - useful for identifying
 PT enhanced wound healing genes.
 PT
 XX Claim 13; Page 74; 136pp; English.
 PS
 XX This invention describes a novel non-MRL healer mouse (M) having at least
 CC one quantitative trait locus selected from those given in the
 CC specification, exhibiting an enhanced healing response to a wound
 CC compared to mice (m) without the locus. The invention describes a novel
 CC method of identifying a gene involved in enhanced wound healing by
 CC identifying DNA microsatellite markers which can distinguish healer
 CC from non-healer mice and identifying microsatellite markers which
 CC segregate with enhanced wound healing in progeny of the mice, where a
 CC chromosomal locus containing at least one enhanced wound healing gene is
 CC identified. A method of treating a wound in a mammal is also disclosed.

CC The new methods are useful for treating wounds, especially central and
CC peripheral nerve wound. The methods of the invention are useful for
CC restoring function after nerve injury in a mammal. (M) is useful as a
CC mammalian model of enhanced wound healing, useful for identifying genes
CC and gene products involved in enhanced wound healing, and to provide
CC methods for wound healing. AA218591-219036 represent murine SAGE tags
CC from C57BL/6 and MRL mice which are used to illustrate the method of the
CC invention

XX Novel modified oligonucleotides, useful in antisense methodologies,
XX diagnostics, therapeutics and as research reagents.

XX Example 53; Page 57; 75pp; English.

XX This sequence represents a modified oligonucleotide used in the thermal
CC melt analysis of 2',5'-linked oligonucleotides versus 3',5'-linked
CC oligonucleotides. The 2',5'-linkages demonstrate a higher melting
CC temperature against an RNA target compared to a DNA target. The invention
CC relates to oligonucleotides comprising nucleotides covalently linked
CC together by internucleotide linkages where at least 1 nucleotide is
CC linked to adjacent nucleotide by a 2',5'-internucleotide linkage and
CC bears a 3'-substituent. The oligonucleotides can be used in gene therapy
CC and are also useful in antisense methodologies, diagnostics, therapeutics
CC and as research reagents

XX Identifying genes involved in skin stress and aging, useful e.g. in
XX screening for cosmetic or therapeutic agents, based on differential gene
XX expression.
XX Claim 8; Page 57; 325pp; German.
XX The invention relates to identifying (M1) genes in vitro that, in humans
XX or animals, are important for skin ageing and/or skin stress by serial
XX analysis of gene expression between mixtures of transcribed and
XX optionally translated, genetically encoded factors (A) obtained from
XX young and aged skin, to identify that genes that show strong differential
XX expression. (A) comprises protein or mRNAs or their fragments. (M1) is
XX useful for: identifying markers of skin ageing and/or stress; determining
XX skin ageing and/or stress; and identifying or determining the effects of
XX pharmaceutical or cosmetic agents for control of skin ageing. The present
XX sequence is one of a group of human skin ageing/stress related expressed
XX sequence tags (ABQ86246-ABQ87680) of the invention

XX
CC The invention relates to in vitro identification (M1) of genes expressed
CC in the skin of humans or animals by subjecting a mixture of genetically
CC encoded factors from skin, to serial analysis of gene expression (SAGE)
CC so as to identify skin-expressed genes and quantify their expression.
CC (M1) is useful for identifying genes involved in skin homeostasis; to
CC determine skin homeostasis and to test agent (A) that maintains or
CC promotes skin homeostasis or that can be used for treating skin
CC disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma;
CC ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus;
CC rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the
CC skin. The present sequence is that of a human expressed sequence tag

 XX In vitro identification of skin-expressed genes, useful for determining
 PT homeostasis and identifying cosmetic or pharmaceutical agents against
 PT e.g. skin cancer.
 XX Claim 24; Page 248; 1345pp; German.
 XX The invention relates to in vitro identification (M1) of genes expressed
 CC in the skin of humans or animals by subjecting a mixture of genetically
 CC encoded factors from skin, to serial analysis of gene expression (SAGE)
 CC so as to identify skin-expressed genes and quantify their expression.
 CC (M1) is useful for identifying genes involved in skin homeostasis; to
 CC determine skin homeostasis and to test agent (A) that maintains or
 CC promotes skin homeostasis or that can be used for treating skin
 CC disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma;
 CC ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus;
 CC rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the
 CC skin. The present sequence is that of a human expressed sequence tag
 CC (EST) of the invention

PT Assembling gene constructs from a number of DNA fragments, and the
PT plasmid produced (pWB) which is useful for assembling synthetic genes,
PT constructs, vectors and chromosomes.
XX
PS Claim 14; Page 9; 12pp; English.
XX
CC The patent discloses methods for assembling gene constructs from a number
CC of DNA fragments to produce the plasmid (pWB). The vectors produced (pWB)
CC are used for the construction of a gene, vector, construct, combinatorial
CC library or chromosome and for trimming one or more bases from the ends of
CC insert fragments. The vectors of the invention facilitates the placement
CC of unique, non-palindromic address tags at the ends of the fragments and
CC allows validation of the fragments prior to assembly to assure that the
CC resulting construct is free of mutations. The present sequence is pWB
CC plasmid DNA half-site. This sequence is a combination of a SapI site with
CC an overlapping NruI site. This combination allows trimming of three bases
CC from one end of a nucleic acid molecule cloned in the NruI site

XX New adaptor molecules, useful for cloning nucleic acid molecules that
XX does not require the design and synthesis of oligonucleotides or PCR
XX primers.
XX
XX Claim 12; Fig 1; 100pp; English.
XX
XX The invention describes adaptor molecules, where each end of the adaptor
XX is compatible with a nucleic acid digested with a restriction enzyme or a
XX nucleic acid comprising an end that is compatible with a nucleic acid
XX digested with a restriction enzyme. The adaptor molecules, compositions,
XX kits and arrays are useful for cloning nucleic acid molecules that does
XX not require the design and synthesis of oligonucleotides or PCR primers.
XX The adaptors, kits and arrays are also useful for ligating two ends of a
XX single nucleic acid molecule, or ligating two or more nucleic acid
XX molecules. The kits can also be used for performing internal deletion
XX mutagenesis analysis. The adaptor molecules are ligated to a cloning
XX vehicle, making the cloning procedure more rapid and efficient, and less
XX error-prone. This sequence represents a nucleic acid cloning associated
XX adaptor molecule

XX Differential screening of gene expression by reverse transcription
PT polymerase chain reaction - uses random priming with primers selected for
PT high efficiency and selectivity by computer screening of database(s).
XX
PS Claim 9; Page 24; 37pp; English.
XX
CC The invention provides a method for the differential screening of gene
CC expression by random primed reverse transcription PCR (RT-PCR). The
CC primer sequences are generated by stimulating PCR reactions on non-
CC redundant mammalian nucleotide sequence databank entries containing at
CC least 1,000 bp of coding region. The primers selected, such as the
CC present one, had to meet various criteria such as having an efficiency
CC index between 2-10, having a selectivity index higher than 1, being 12 bp
CC long i.e. 8 C or G and 4 T or A, and each primer differed from the others
CC in at least 5 of the 8 bases at the 3'-end. The invention claims the
CC selected primers make it possible to use internally primed, PCR-based RNA
CC fingerprinting for simple, exhaustive and systematic analysis of
CC differential gene expression as an advantageous alternative to
CC differential display. The method can also be useful for isolating new
CC coding sequences and to compare known and new genes

PT Novel polymerase chain reaction method, for differentiating between
PT microorganisms and for detecting contaminants.
XX
PS Example 1; Page 22; 78pp; German.
XX
CC This invention describes a novel method for the amplification of DNA
CC comprising (i) preparing many primers (P) with different probabilities of
CC amplification and (ii) simultaneous polymerase chain reaction (PCR) of
CC many different DNA using these primers. The method is used (i) to
CC differentiate between different microorganisms in a mixed population and
CC (ii) to determine presence/absence of an impurity (pollutant), or its
CC concentration, in e.g. soil, foods, compost etc., typically metals,
CC agricultural chemicals, polymers, organochlorine compounds etc. A
CC particular use is monitoring composting of organic material.
CC Amplification with many primers produces a lot of information, so
CC reliability of the test is improved, and many samples may be tested
CC quickly. AAZ41640-241855 represent the primers described in the method of
CC the invention. (Updated on 20-MAR-2003 to correct PR field.)

XX XX
XX Novel polymerase chain reaction method, for differentiating between
XX microorganisms and for detecting contaminants.
XX
XX Example 1; Page 17; 78pp; German.
XX
XX This invention describes a novel method for the amplification of DNA
XX comprising (i) preparing many primers (p) with different probabilities of
XX amplification and (ii) simultaneous polymerase chain reaction (PCR) of
XX many different DNA using these primers. The method is used (i) to
XX differentiate between different microorganisms in a mixed population and
XX (ii) to determine presence/absence of an impurity (pollutant), or its
XX concentration, in e.g. soil, foods, compost etc., typically metals,
XX agricultural chemicals, polymers, organochlorine compounds etc. A
XX particular use is monitoring composting of organic material.
XX Amplification with many primers produces a lot of information, so
XX reliability of the test is improved, and many samples may be tested
XX quickly. AAZ41640-241855 represent the primers described in the method of
XX the invention. (Updated on 20-MAR-2003 to correct PR field.)

Amplification of a DNA fragment - in order to establish the state of
existence of a microbe.
Example; Page 10; 40pp; Japanese.
A method has been developed for the amplification of a DNA fragment in
which amplification is carried out on the DNA fragments of a number of
different DNAs. The method comprises a PCR reaction repeatedly carrying
out a heat-denaturing step, a primer annealing step and a polymerase
extending step, to amplify the DNA fragments of a plural of different
DNAs. The method can detect the existence of a microbe in organic waste.
AAZ41424 to AAZ41639 represent PCR primers used in random amplified
polymorphic DNA arbitrarily primed PCR, for the detection of microbes in
organic waste

 XX
 XX Identifying, comparing and detecting inhibitors of protein-protein
 PT interactions within population of host cells, involves detecting
 PT regulation of transcription of nucleic acid sequence by fusion protein
 PT interaction.
 XX
 XX Example; Col 155; 161pp; English.
 PS
 XX The present invention describes a method for detecting (D) at least 1
 CC protein-protein interaction (PPI) by recombinantly expressing within a
 CC population of host cells, populations of first and second fusion proteins
 CC comprising DNA binding domain (DBD) and transcriptional regulatory domain
 CC (TRD) respectively and detecting the regulation of transcription of

CC nucleotide sequence of host cells operably linked to a promoter driven by
 CC DBD. The detection method (D) is useful for identifying inhibitors of PPI
 CC for therapeutic use, and for detecting specific cell types, tissue types,
 CC stage of development and disease states. From the population of the
 CC proteins characteristic of the particular tissue or a cell-type, all
 CC possible detectable PPI that occur can be identified and genes encoding
 CC these proteins can be isolated. Thus, parallel analysis of two cell types
 CC enumerates PPI that are common to both and those that are specific to
 CC both. This analysis has significant value since PPI specific to a disease
 CC state can serve as therapeutic points of intervention. Inhibitors of PPI
 CC can also be isolated in rapid fashion. The number of false positives and
 CC low throughput are reduced. AAA55843 to AAA55963 and AA190961 are
 CC sequences used in the exemplification of the present invention

 XX
 XX Isolated nucleic acid molecule encoding a photoreceptive retinaldehyde-
 PT binding protein for use in antisense therapeutics.
 PT
 PS Disclosure; Col 3; 40pp; English.
 XX
 XX The invention relates to mammalian retinaldehyde binding proteins and
 CC nucleotides encoding them. Retinaldehyde binding protein is the first
 CC light-absorbing vertebrate protein identified to stably and
 CC preferentially bind the all-trans-retinal chromophore. Retinaldehyde
 CC binding proteins have distant homology to other G protein-coupled
 CC receptors, possessing seven transmembrane domains. The nucleic acid and
 CC encoded protein are useful for assaying changes in the structure or the
 CC retinaldehyde-binding proteins which would be indicative of a molecular
 CC aberration in the retinal pigment epithelium, visual system or brain. The
 CC nucleic acid is also useful in antisense therapeutics and in the
 CC recombinant expression of retinaldehyde-binding protein. This sequence
 CC represents an inserted sequence that is present in human retinaldehyde
 CC binding protein cDNA clone HRGR33 at a position corresponding to

```

PT

PT dysfunctions such as Parkinson's disease involves use of biological array
PT including all genes associated with neurotransmitter molecules.
XX Disclosure; Page 38; 76pp; English.
XX The present invention describes a method for identifying genetic
CC predisposition to, susceptibility to development of, characteristics of,
CC or persistence of physiological or pathological response to, a
CC neurotransmitter factor-related condition (NFC). The method comprises
CC identifying genetic polymorphisms in neurotransmitter genes associated
CC with NFC, using a multiple biological sample array. The method can be
CC used for making a biological chip plate which is useful for identifying
CC genetic predisposition to, susceptibility to development of,
CC characteristics of, or persistence of physiological or pathological
CC response to a NFC, genetic polymorphisms or gene expression in several
CC neurotransmitter genes, preferably opioid system genes, associated with
CC the NFC. The chip plates are useful in prognosis of neurological
CC disorders such as addiction, schizophrenia, Tourette's syndrome, drug
CC abuse, attention deficit disorder, anxiety, depression, obsessive-
CC compulsive disorder, stroke, obesity, response to pain, hypertension,
CC vascular disorders, migraine, nausea, Alzheimer's disease, aggressive
CC behaviour, premenstrual syndrome, diabetic neuropathy, suppression of
CC alcohol intake, and Parkinson's disease. A DNA array can determine the
CC particular strain of a pathogenic organism based on characteristic DNA
CC sequences of the strain. The present sequence represents an
CC oligonucleotide probe for a single nucleotide polymorphism (SNP) in the
CC mu opioid receptor (MOR), which is used in the exemplification of the
CC present invention

Set of oligonucleotides, useful for diagnosis and cell typing, is
designed to detect single-nucleotide polymorphisms and cytosine
methylation status.
XX
Claim 1; SEQ ID NO 341830; 29pp + Sequence Listing; German.
XX
This invention describes novel oligonucleotide primers or peptide nucleic
acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP)
and cytosine methylation status in chemically pretreated genomic DNA. The
oligonucleotides are used for diagnosis and/or prognosis of cancer and a
range of diseases including immune system, gastrointestinal, respiratory,
central nervous system, cardiovascular and metabolic disorders. The
oligonucleotides are also used for detecting cell type differentiation. ABC00010
-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073
represent the oligomers described in the invention. NOTE: The sequence
data for this patent did not form part of the printed specification, but
was obtained in electronic format from WIPO at

 PT designed to detect single-nucleotide polymorphisms and cytosine
 PT methylation status.

XX PS Claim 1; SEQ ID NO 358520; 29pp + Sequence Listing; German.

XX CC This invention describes novel oligonucleotide primers or peptide nucleic
 CC acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP)
 CC and cytosine methylation status in chemically pretreated genomic DNA. The
 CC oligonucleotides are used for diagnosis and/or prognosis of cancer and a
 CC range of diseases including immune system, gastrointestinal, respiratory,
 CC central nervous system, cardiovascular and metabolic disorders. The
 CC oligomers are also used for detecting cell type differentiation. ABC00010
 CC -ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073
 CC represent the oligomers described in the invention. NOTE: The sequence
 CC data for this patent did not form part of the printed specification, but
 CC was obtained in electronic format from WIPO at

XX
XX Detection of protein to protein interactions amongst two protein
XX populations useful e.g. to identify interactions specific for particular
XX tissues or diseases and to identify inhibitors of interactions uses a new
XX genetic method.
XX
XX Example; Col 179; 152pp; English.
XX
XX The present invention relates to novel methods for detecting protein to
XX protein interactions amongst two populations of proteins, each having a
XX complexity of at least 100. The method involves using new genetic methods
XX in which encoded proteins are fused to either the DNA-binding domain of a
XX transcriptional activator or the activation domain of a transcriptional
XX activator. The methods are useful to detect interacting proteins and to
XX identify protein-protein interactions specific for a particular species,
XX tissue, stage of development or disease state, e.g. by comparing protein-
XX protein interactions between populations from cDNA of cancerous or pre-
XX cancerous cells with those from non-cancerous cells. They are also useful
XX to identify inhibitors interfering with protein-protein interactions e.g.
XX potential drug candidates inhibiting interactions specific to cancerous
XX cells. The present DNA sequence is a PCR primer which is specific for
XX Hind III restriction enzyme. This primer is used to illustrate the method
XX of the invention

New antisense oligonucleotides useful for treating e.g. pulmonary
XX vasoconstriction, inflammation, allergies, asthma, hypertension,
XX bronchitis, emphysema, respiratory distress syndrome, ischemia or
XX cancers.
XX Claim 18; Page 401; 1343pp; English.
XX
XX The present invention describes a new composition comprising an antisense
XX oligonucleotide (ON) with low adenosine (up to 15%), which targets
XX nucleic acids involved in bronchoconstriction, allergies, and/or
XX inflammation. The ON can have antiinflammatory, antiallergic,
XX antiasthmatic, cytostatic and analgesic activities. The compositions are
XX useful for the treatment of diseases associated with inflammation,
XX impaired airways, including lung disease and diseases whose secondary
XX effects afflict the lungs of a subject. They can be used for treating
XX e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
XX impeded respiration, respiratory distress syndrome, pain, cystic
XX fibrosis, pulmonary hypertension, emphysema, chronic obstructive
XX pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,
XX carcinomas, and cancers which may metastasize to the lungs, including
XX breast and prostate cancer. The reduction of the adenosine content of the
XX ONs reduces side effects. The A-containing ONs break down with the
XX release of deoxyadenosine which activates adenosine receptors causing
XX bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
XX nucleotide sequences given in the sequence listing from the present
XX invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
XX sequences are also called SEQ ID NO:1 to 185, but the sequences differ
XX from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to
XX AAA33992) are specifically claimed ONs from the present invention. N.B.

 XX Low adenosine (A) content antisense oligonucleotides which do not trigger
 PT adenosine receptors during metabolism, useful e.g. for treating cancers
 PT and respiratory obstructions.
 XX
 XX Claim 14; Page 206; 1592pp; English.
 PS
 XX The present invention describes low adenosine (A) content antisense
 CC oligonucleotides and compositions (I) comprising them. In the antisense
 CC oligonucleotides the A is replaced by a 'Universal' or alternative base.
 CC (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
 CC immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
 CC The antisense oligonucleotides and (I) can be used to down-regulate the
 CC expression and or activity of target polypeptides associated with
 CC lung/respiratory disorders and malignancies, such as stimulating and
 CC activating peptide factors and transmitters, transcription factors,
 CC immunoglobulins and antibodies, antibody receptors, cytokines and
 CC chemokines, endogenously produced specific and non-specific enzymes,
 CC binding proteins, adhesion molecules and their receptors, cytokine and
 CC chemokine receptors, adenosine receptors, bradykinin receptors, central
 CC nervous system (CNS) and peripheral nervous and non-nervous system
 CC receptors, CNS and peripheral nervous and non-nervous system peptide
 CC transmitters, defensins, growth factors, vasoactive peptides and
 CC receptors, binding proteins and malignancy associated proteins. The
 CC antisense oligonucleotides may be used in this way to treat disorders
 CC including respiratory obstruction (especially pulmonary obstruction
 CC and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
 CC surfactant hypoproduction which are associated with a disease or
 CC condition selected from pulmonary vasoconstriction, inflammation,
 CC allergies, asthma, impeded respiration, respiratory distress syndrome
 CC (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary
 CC hypertension, emphysema, chronic obstructive pulmonary disease (COPD),
 CC pulmonary transplantation rejection, pulmonary infections, bronchitis,
 CC and/or cancer. AAF18434 to AAF21543 represent human polynucleotide
 CC fragments and antisense oligonucleotides used in the exemplification of
 CC the present invention

 XX New zinc finger protein that binds to target site, useful in studying
 PT gene function and for human therapeutics and plant engineering, comprises
 PT first, second and third zinc fingers, ordered from N- to C-terminus.
 XX
 XX Example 1; Page 63; 81pp; English.
 PS
 XX The present invention describes a zinc finger protein (I) that binds to a
 CC target site, comprising a first (F1), a second (F2), and a third (F3)
 CC zinc finger, ordered F1, F2, F3 from N-terminus to C-terminus, where the
 CC target site comprises, in 3'-5' direction, a first (S1), a second (S2),
 CC and a third (S3) target subsite. Also described are: (1) a polypeptide
 CC (II) comprising (I); (2) a polynucleotide (III) encoding (I) or (II); and
 CC (3) designing (M) (I) involves selecting the F1 zinc finger such that it
 CC binds to the S1 target subsite, selecting the F2 zinc finger such that it
 CC binds to the S2 target subsite, and selecting the F3 zinc finger such
 CC that it binds to the S3 target subsite, thus designing (I) that binds to
 CC a target site. (I) is useful for recognition of triplet target subsites
 CC having the nucleotide G in the 5'-most position of the subsite. (I) is
 CC useful in studying gene function, and for human therapeutics and plant
 CC engineering. (I), (II) or (III) is useful in therapeutic methods to
 CC modulate the expression of a target region within a subject, in
 CC diagnostic methods for sequence specific detection of target nucleic acid
 CC in a sample, and in assays to determine the phenotype and function of
 CC gene expression. (I) has improved affinity and specificity for their
 CC target sequences, as well as enhanced biological activity. ABQ71213 to
 CC ABQ72214 and ABP48191 to ABP51230 represent DNA target sequences and zinc
 CC finger peptides which are given in the exemplification of the present
 CC invention

XX Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
XX Disclosure; SEQ ID NO 10461; 872pp; English.
XX
XX The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cycostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

XX
XX Assay for alleles or muscle fibre composition characteristic of Duroc
XX type pigs - comprises determination of genotype or muscle fibre
XX properties, used to identify animals for breeding programs and to assess
XX meat quality.
XX
XX Example 3; Page 32; 56pp; English.
XX
XX PCR primers AAV35877-996 were used in a rapid amplification of
XX polymorphic DNA (RAPD) reaction in the assay of the invention. This assay
XX is used to determine if an animal has an allele for, or muscle fibre
XX composition (MFC) characteristic of, the Duroc pig. Duroc pigs produce
XX meat of superior quality (particularly tenderness) but are normally less
XX efficient feed converters and fatter than other types. The assay
XX comprises analysing a tissue sample to determine if the genotype
XX comprises the allele, and genetic features typical of animals with Duroc-
XX type MFC are present. The method is used to select animals that have
XX Duroc characteristics for use in breeding programmes (to develop the
XX animals with Duroc pig characteristics), and to assess meat quality

XX
XX Newly isolated nucleic acid molecule (designated p23) encoding a p23
XX polypeptide - useful for inducing a senescence phenotype in a cell.
XX

```

```

PS Example 1; Page 19; 44pp; English.
XX
XX The present invention describes human senescence factor p23. An
XX expression vector for p23 is useful for inducing a senescent phenotype in
XX a cell (preferably eukaryotic). This may help in regulating diseases, and
XX including cancer, persistent inflammation, and various proliferative, and
XX degenerative disorders. These transgenic cells are useful in gene therapy
XX for treating cancer, particularly where antisense oligonucleotides are
XX useful for blocking normal or mutant p23 expression in cancer cells or
XX other proliferating cells. Transgenic cells are also useful for producing
XX the p23 polypeptide in large quantities. The antibodies are useful for
XX raising antiserum against p23, and for identifying senescent cells in
XX culture and tissue biopsies. The p23 polynucleotides are useful for
XX modulating or altering p23 activity in a cell, and for identifying and
XX isolating the whole gene encoding p23, and variants of p23. Assays based
XX on p23 elements, which detect p23 levels and activity are useful as
XX diagnostic markers for staging tumours, determining prognosis, and/or
XX predicting therapeutic success. These elements also provide an assay for
XX detecting chromosomal rearrangements in chromosome 3 in a human cell. The
XX isolation of the p23 polynucleotide permits the manipulation of malignant
XX growth in cancer. The present sequence represents a primer used in an
XX example from the present invention

XX PT New RNA transcriptional regulators - used for modulating gene expression
XX PT in vitro or in vivo, e.g. as therapeutic agents for treating e.g. cancer
XX PT or anaemia.
XX XX
XX PS Example 2; Page 23; 57pp; English.
XX XX
XX CC The invention provides novel transcriptional regulators (TR) that are
XX CC comprised of RNA molecules. The TR comprises a DNA-binding moiety and an
XX CC RNA linked to the DNA binding moiety, where the RNA has TR activity.
XX CC Methods of identifying such RNA TRs are also provided. The RNA TRs alter
XX CC the rate and/or the extent of transcription from a promoter when they are
XX CC delivered to a site that is operationally linked to that promoter. The
XX CC TRs can affect transcription initiation, elongation, reinitiation,
XX CC termination and pausing. They can be used in e.g. bacterial cells, yeast
XX CC cells, mammalian cells, insect cells, plant cells, reptile cells,
XX CC celenterate cells, and protozoan cells. They can be used as agents for
XX CC controlling gene expression, e.g. to modulate gene expression in vivo in
XX CC order to alleviate or correct a disease state, e.g. cancer, anemia and
XX CC other disorders related to erythrocyte production. Sequences AAX32305-312
XX CC represent radioactivator isolate sequences obtained from a R10 library

other transcripts correspond to novel genes. Antigen-presenting cell (APC)-associated costimulatory factors play an important role in the activation of the cytotoxic immune response, particularly against tumour cells. Tumour antigen presentation via the MHC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cytotoxic immune response that can lyse the tumour cells. Immunostimulatory cofactors also being required for efficient activation of cytotoxic T-lymphocytes (CTLs). Nucleic acid sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen for agents that modulate expression of differentially expressed genes in an APC; and as hybridisation probes/amplification primers for the diagnosis, prognosis and monitoring of diseases related to abnormal expression of these genes. Detection of the dendritic cell differentially expressed genes, or of their encoded proteins, can be used to identify cells as belonging to the monocyte lineage. Cells containing these genes can be used in active immunotherapy (or to stimulate production of a population of antigen-specific effector cells) and vectors containing them are used in gene therapy. Co-administration of tumour antigens and APC-associated costimulatory factors ensures adequate antigen presentation to endogenous APCs and upregulates the APCs for the presentation of co-stimulatory signals, migration to T cell-rich sites, secretion of T cell growth factors and secretion of chemokines for recruitment of immune effector cells

XX Isolated polynucleotides differentially expressed in antigen-presenting

XX cells, useful in gene vaccines against cancer.

XX Claim 1; Page 100; 130pp; English.

XX Sequences AAZ77573-279709 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts encoding immunostimulatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTs (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while other transcripts correspond to novel genes. Antigen-presenting cell (APC)-associated costimulatory factors play an important role in the activation of the cytotoxic immune response, particularly against tumour cells. Tumour antigen presentation via the MHC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cytotoxic immune response that can lyse the tumour cells, immunostimulatory cofactors also being required for efficient activation of cytotoxic T-lymphocytes (CTLs). Nucleic acid sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen for agents that modulate expression of differentially expressed genes in an APC; and as hybridisation probes/amplification primers for the diagnosis, prognosis and monitoring of diseases related to abnormal expression of these genes. Detection of the dendritic cell differentially expressed genes, or of their encoded proteins, can be used to identify cells as belonging to the monocyte lineage. Cells containing these genes can be used in active immunotherapy (or to stimulate production of a population of antigen-specific effector cells) and vectors containing them are used in gene therapy. Co-administration of tumour antigens and APC-associated costimulatory factors ensures adequate antigen presentation to endogenous APCs and upregulates the APCs for the presentation of co-stimulatory signals, migration to T cell-rich sites, secretion of T cell growth factors and secretion of chemokines for recruitment of immune effector cells

 by standard immunoassays or hybridisation/amplification reactions.
 Compounds that modulate expression of the transcripts are potentially
 useful for treatment of (metastatic) breast cancer, while promoters from
 the transcripts are used to direct expression, in selected cell types, of
 e.g. therapeutic genes (also ribozymes or antisense sequences),
 particularly an antigen-encoding sequence for use in gene or cell-based
 vaccines. Polypeptides encoded by the transcripts are also useful in
 vaccines; for diagnosing breast cancer and for raising specific
 antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic
 agents. Host cells that produce the polypeptides can be used to expand
 and isolate populations of educated, antigen-specific immune effector
 cells, e.g. cytotoxic T lymphocytes, and these used for adoptive
 immunotherapy

AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts
 that are preferentially transcribed in the metastatic breast tumour
 tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942
 to AAZ86677 represent tags corresponding to distinct transcripts that are
 preferentially transcribed in the primary or non-metastatic breast tumour
 tissue (i.e. are downregulated in metastatic breast tumour cells). These
 transcripts can be used for diagnosis, prognosis, monitoring and
 treatment of breast cancer, particularly where metastatic. Diagnosis is
 by standard immunoassays or hybridisation/amplification reactions.
 Compounds that modulate expression of the transcripts are potentially
 useful for treatment of (metastatic) breast cancer, while promoters from
 the transcripts are used to direct expression, in selected cell types, of
 e.g. therapeutic genes (also ribozymes or antisense sequences),
 particularly an antigen-encoding sequence for use in gene or cell-based

 Genes most frequently expressed in human monocytes and GM-macrophages and
 M-macrophages studied and with cDNAs characterized, for study of gene
 specificity, disease onset mechanism, drug development and diagnosis.
 XX
 Claim 7; Page 72; 138pp; Japanese.
 XX
 The present invention describes 100 human genes, which are expressed most
 CC frequently in human monocytes. The cDNA of each gene has a sequence fully
 CC defined in the specification, and lacking the CATG sequence located
 CC adjacent to polyA region. Also described are: (1) an antibody
 CC specifically for the protein encoded by any of the genes; (2)
 CC oligonucleotides obtained from the cDNA sequences; (3) 380 human genes
 CC which are expressed most frequently in human macrophages, differentiated
 CC from human monocytes by granulocyte-macrophage colony-stimulating factor,
 CC the cDNA of each gene has a fully defined sequence, given in the

CC specification, lacking the base sequence CATG located most closely to the
 CC poly A region; (4) an antibody specifically for the protein encoded by
 CC any of the genes of (3); and (5) oligonucleotides obtained from the cDNA
 CC sequences of (3). The genes and cDNAs, are used for the study of gene
 CC specificity and disease onset mechanism e.g. oncogenesis, genetic
 CC diseases, drug development and diagnosis. AA56107 to AA56586 represent
 CC specifically cloned oligonucleotide tag sequences for human genes
 CC expressed in monocytes and macrophages

 PT Detecting DNA polymorphisms, useful e.g. for identifying organisms by
 PT species, strain or serotype, comprises amplification with primers based
 PT on over-represented oligonucleotide sequences.
 XX
 PS Example; Page 28; 49pp; English.
 XX
 CC The invention relates to a novel method for the detection of
 CC polymorphisms in a DNA sequence. Test DNA and a second DNA are amplified
 CC with at least one pair of primers, and the sequence differences between
 CC the amplicons are compared. The primers are based on oligonucleotide
 CC sequences that are over-represented in the genome of the relevant
 CC organism, and which are biased to one strand. The method can be used to
 CC identify an organism by species, serotype or strain, in which case
 CC amplicons are analysed for products, common to all members of the
 CC species, and those specific for strain or serotype, and the results
 CC compared with an existing database. The method can also be used to
 CC identify an individual, by comparison of results for a test DNA with an
 CC existing database. When applied to differential display analysis, pattern
 CC differences in the amplicons are determined, particularly by a
 CC quantitative method such as densitometry, fluorimetry or radiometry. The
 CC method of the invention is used to identify individuals, to classify
 CC organisms by species, strain or serotype, and to identify genes based on

CC differential display. The method can also be used for genomic mapping,
 CC detecting changes in expression patterns, genetic linkage studies,
 CC medical diagnosis, epidemiology, forensics, and agriculture. The method
 CC uses over-represented sequences to prime amplification. These sequences
 CC are distributed over the entire genome, so analysis is not restricted to
 CC particular regions, and a single primer pair can amplify up to 5% of the
 CC complete Escherichia coli genome. The primers are rationally designed, so
 CC non-specific amplification is limited and the method does not require
 CC restriction enzymes or adapters. Sequences AAA14149-AA14154 represent PCR
 CC primers based on over-represented octamer sequences biased to the leading
 CC strand of the E. coli K-12 genome and are fluorescently labelled at the
 CC 5' end. These primers, and lagging strand primers AAA14155-AAA14160 were
 CC used in the exemplifications of the invention to differentiate and
 CC further characterise two strains of E. coli 0157:H7 (strains FR1K 1641
 CC and FR1K 533) and two strains from the ECOR collection (ECOR 20 and ECOR
 CC 50). (Updated on 15-SEP-2003 to standardise OS field)

PT e.g. soya bean or sesame seed with high protein/fatty acid content,
PT comprises introducing antisense gene.
XX
PS Example 8; Page 9; 25pp; Chinese.
XX
CC The present invention describes a method for altering the protein/fatty
CC acid composition of seeds. The method comprises: (1) cloning
CC phosphoenopyruvate carboxylase (PEP) or acetyl-CoA carboxylase (ACC)
CC genes or their fragments; (2) constructing the corresponding antisense
CC gene of anti-PEP or anti-ACC; and (3) introducing the antisense gene into
CC the plant cell of a crop. The method is applicable in plant breeding to
CC give oilseed crops with high oil or protein content like soya bean,
CC sunflower, rapeseed, peanut and sesame. The produced crop plants have
CC high yield of oil or protein. The present sequence represents an
CC oligonucleotide which is used in the construction of an anti-PEP gene in
CC an example from the present invention

 XX Yeast gene coding sequences comprising NORF genes with serial analysis of
 PT gene expression (SAGE) tags, useful for studying, monitoring and
 PT affecting phases of the cell cycle.
 XX Example; Page 60; 419pp; English.
 XX The present invention describes an isolated DNA molecule comprising a
 CC coding sequence of a yeast gene selected from a group of 745 NORF (not
 CC previously assigned open reading frame; or nonannotated ORF) genes
 CC comprising a SAGE (serial analysis of gene expression) tag. Also
 CC described are: (1) a method (M1) of using NORF genes to affect the cell
 CC cycle comprising administering a NORF gene whose expression varies by at
 CC least 10% between any two phases of the cell cycle selected from log
 CC phase, S phase and G2/M; (2) a method (M2) for screening candidate
 CC antifungal drugs comprising: (a) contacting a test substance with a yeast
 CC cell; and (b) monitoring expression of a NORF gene whose expression
 CC varies as in M1, where a test substance which modifies the expression of
 CC the yeast gene is a candidate antifungal drug; (3) a method (M3) for
 CC identifying human genes which are involved in cell cycle progression
 CC comprising contacting human DNA with a probe which comprises at least 10
 CC contiguous nucleotides of a NORF gene whose expression varies as in M1;
 CC and (4) a method (M4) for identifying a candidate drug as a member of a
 CC class of drugs having a characteristic effect on gene expression in a
 CC yeast cell comprising contacting a yeast cell with a candidate drug and
 CC monitoring expression in the yeast cell of at least 1 NORF gene whose
 CC expression is affected by the class of drugs. The NORF genes may be used
 CC to study, monitor and affect phases of the cell cycle, the differentially
 CC expressed genes may be used as markers of phases of the cell cycle. The
 CC methods may be used to identify candidate drugs which affect the cell
 CC cycle and for identification of antifungal drugs. AAF33268 to AAF44064
 CC represent SAGE tags used in the exemplification of the present invention.

XX Yeast gene coding sequences comprising NORF genes with serial analysis of
PT gene expression (SAGE) tags, useful for studying, monitoring and
PT affecting phases of the cell cycle.
XX
XX Example; Page 210; 419pp; English.
XX
XX The present invention describes an isolated DNA molecule comprising a
CC coding sequence of a yeast gene selected from a group of 745 NORF (not
CC previously assigned open reading frame; or nonannotated ORF) genes
CC comprising a SAGE (serial analysis of gene expression) tag. Also
CC described are: (1) a method (M1) of using NORF genes to affect the cell
CC cycle comprising administering a NORF gene whose expression varies by at
CC least 10% between any two phases of the cell cycle selected from log
CC phase, S phase and G2/M; (2) a method (M2) for screening candidate
CC antifungal drugs comprising: (a) contacting a test substance with a yeast
CC cell; and (b) monitoring expression of a NORF gene whose expression
CC varies as in M1, where a test substance which modifies the expression of
CC the yeast gene is a candidate antifungal drug; (3) a method (M3) for
CC identifying human genes which are involved in cell cycle progression

comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to study, monitor and affect phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAF33268 to AAF44064 represent SAGE tags used in the exemplification of the present invention. CC AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present invention

XX
XX Yeast gene coding sequences comprising NORF genes with serial analysis of
PT gene expression (SAGE) tags, useful for studying, monitoring and
PT affecting phases of the cell cycle.
XX
XX Example; Page 109; 419pp; English.
XX
XX The present invention describes an isolated DNA molecule comprising a
CC coding sequence of a yeast gene selected from a group of 745 NORF (not
CC previously assigned open reading frame; or nonannotated ORF) genes
CC comprising a SAGE (serial analysis of gene expression) tag. Also
CC described are: (1) a method (M1) of using NORF genes to affect the cell
CC cycle comprising administering a NORF gene whose expression varies by at
CC least 10% between any two phases of the cell cycle selected from log
CC phase, S phase and G2/M; (2) a method (M2) for screening candidate
CC antifungal drugs comprising: (a) contacting a test substance with a yeast
CC cell; and (b) monitoring expression of a NORF gene whose expression
CC varies as in M1, where a test substance which modifies the expression of
CC the yeast gene is a candidate antifungal drug; (3) a method (M3) for
CC identifying human genes which are involved in cell cycle progression
CC comprising contacting human DNA with a probe which comprises at least 10
CC contiguous nucleotides of a NORF gene whose expression varies as in M1;
CC and (4) a method (M4) for identifying a candidate drug as a member of a
CC class of drugs having a characteristic effect on gene expression in a
CC yeast cell comprising contacting a yeast cell with a candidate drug and
CC monitoring expression in the yeast cell of at least 1 NORF gene whose
CC expression is affected by the class of drugs. The NORF genes may be used
CC to study, monitor and affect phases of the cell cycle, the differentially
CC expressed genes may be used to identify candidate drugs which affect the cell
CC cycle and for identification of antifungal drugs. AAF33268 to AAF4064
CC represent SAGE tags used in the exemplification of the present invention.

 PT Isolated polynucleotide comprising a related RAS viral (r-ras) oncogene
 PT homolog (RRAS) isogene (comprising defined polymorphism) useful for
 PT providing haplotype information and drug screening.
 XX
 PS Claim 18; Page 12; 60pp; English.
 CC This invention relates to genetic variants of the human related RAS viral
 CC oncogene RRAS. Ras proteins are a member of a superfamily of small
 CC GTPases that are involved in the regulation of cell growth. The invention
 CC also comprises a related RAS viral (r-ras) oncogene homologue (RRAS)
 CC isogene comprising one or more of the polymorphisms shown. The sequences
 CC of the invention may be used to study the function of RRAS or to treat
 CC disorders such as cancer using antisense therapy. The polymorphic
 CC sequence of the invention is useful for providing haplotype information
 CC of an individual. Furthermore, the polymorphic sequence is useful for
 CC studying the biological function of RRAS as well as identifying drugs
 CC targeting the protein for the treatment of disorders related to its
 CC abnormal expression or function. In particular for validating whether
 CC RRAS is a suitable target for drugs to treat cancer, screening for such
 CC drugs and reducing bias in clinical trials. The present sequence
 CC represents an allele specific oligonucleotide primer #16 used to detect
 CC the human related RAS viral oncogene (RRAS) polymorphisms of the
 CC invention using the primer extension technique

 CC RLBPI activity.
 CC
 PS Claim 18; Page 14; 107pp; English.
 CC The invention relates to an isolated polynucleotide, which comprises
 CC genes and haplotypes of the retinaldehyde-binding protein 1 (RLBPI) gene.
 CC The polynucleotide comprises polymorphic sites in the RLBPI gene, which
 CC are referred to as PS1-24 to designate the order in which they are
 CC located in the gene. Also included are methods for haplotyping or
 CC genotyping the RLBPI gene of an individual, a method for predicting a
 CC haplotype pair for the RLBPI gene of an individual, a method for
 CC identifying an association between a trait and at least one haplotype or
 CC haplotype pair of the RLBPI gene, a composition comprising at least one
 CC genotyping oligonucleotide for detecting a polymorphism in the RLBPI gene
 CC at a PS consisting of PS1-PS24, a kit for genotyping the RLBPI gene of an
 CC individual comprising a set of oligonucleotides designed to genotype each
 CC of PS1-PS24 recombinant non-human organisms transformed or transfected
 CC with the isolated polynucleotide, where the organism expresses an RLBPI
 CC protein encoded by the first nucleotide sequence or expresses an RLBPI
 CC polypeptide comprising the polymorphic variant sequence, an isolated
 CC variant of a reference sequence for the RLBPI protein or its fragment, an
 CC anti-RLBPI antibody, a method for screening for drugs targeting the
 CC isolated polypeptide, and a computer system for storing and analyzing
 CC polymorphism data for the RLBPI oncogene gene. The polynucleotide
 CC comprising polymorphisms in the RLBPI gene is useful in studying the
 CC expression and function of RLBPI, and in expressing RLBPI protein for use
 CC in screening candidate drugs to treat diseases related to RLBPI activity
 CC (e.g. autosomal recessive retinitis pigmentosa (arRP)). The methods and
 CC haplotypes are useful in improving the efficiency and output of several
 CC steps in the drug discovery and development process, including target
 CC validation, identifying lead compounds, and early phase clinical trials.
 CC These are also useful for designing clinical trials of candidate drugs
 CC for treating a specific condition or disease, as well as for screening
 CC compounds targeting RLBPI to treat a specific condition or disease
 CC predicted to be associated with RLBPI activity. The kit and method are
 CC useful for determining whether an individual has one of the haplotypes or
 CC haplotype pairs cited above. The transgenic animals are useful for

PT congenital adrenal hyperplasia and prostate cancer.
XX
PS Claim 18; Page 13; 60pp; English.
XX
CC The invention relates to single nucleotide polymorphisms in the gene
CC encoding the human hydroxy-delta-5-steroid dehydrogenase, 3 beta- and
CC steroid delta-isomerase 2 gene (HSD3B2). A method for haplotyping the
CC HSD3B2 gene in an individual comprises identifying the nucleotide at one
CC or more polymorphic sites and determining whether one of the copies of
CC the gene is defined by one of the HSD3B2 haplotypes given in the
CC specification or whether both copies are defined by a haplotype pair.
CC This method is useful in genotyping, whereby all possible haplotype pairs
CC can be assigned to specific genotypes. An association between a trait and
CC a haplotype or haplotype pair of the HSD3B2 gene can be identified by
CC comparing the frequency of the haplotype or haplotype pair in a
CC population exhibiting the trait with the frequency of the haplotype or
CC haplotype pair in a reference population, where a higher haplotype
CC frequency in the trait population indicates the trait is associated with
CC the haplotype or haplotype pair. HSD3B2 and its corresponding DNA are
CC used for studying the expression and function of HSD3B2, for use in
CC screening for candidate drugs to treat diseases related to HSD3B2
CC activity, such as congenital adrenal hyperplasia and prostate cancer. The
CC sequences are also useful for studying the effect of variation on the
CC biological activity of HSD3B2 as well as on the binding affinity of
CC candidate drugs targeting HSD3B2. Sequences AAS95490-AAS95524 represent
CC allele-specific oligonucleotide probes, sequencing primers and PCR
XX primers used to detect HSD3B2 gene polymorphisms

XX
CC The present invention relates to an isolated human olfactory receptor,
CC family 1, subfamily G, member 1, (OR1G1) polynucleotide comprising a
CC sequence which is a polymorphic variant for a reference sequence for the
CC OR1G1 gene or its fragment, or a polymorphic variant of a reference
CC sequence for a OR1G1 cDNA or its fragment. OR1G1 is useful in studying
CC the expression and function of OR1G1 and in expressing OR1G1 protein for
CC use in screening for candidate drugs to treat diseases related to OR1G1
CC activity. OR1G1 is useful for therapeutic purposes. The invention is
CC useful for studying expression of the OR1G1 isogenes in vivo, for in vivo
CC screening and testing of drugs targeted against OR1G1 protein, and for
CC testing the efficacy of therapeutic agents and compounds for olfactory
CC sensory deficits, in a biological system. The invention is useful in gene
CC therapy and is located on the . The present sequence is human OR1G1 gene
CC polymorphism detecting primer

XX Claim 18; Page 14; 76pp; English.
XX
XX The present invention describes an isolated polynucleotide (I) comprising
XX a nucleotide sequence which is a polymorphic variant of a reference
XX sequence for human phosphorylase kinase gamma2 (testis) (PHK22) gene or
XX its fragment, or a polymorphic variant of a reference sequence for a
XX PHK22 cDNA or its fragment. Also described is an isolated polypeptide
XX (II) comprising an amino acid sequence which is a polymorphic variant of
XX a reference sequence for PHK22 protein or its fragment, where the
XX reference sequence comprises a sequence (see AB09290) of 406 amino
XX acids, and the polymorphic variant comprises one or more variant amino
XX acids selected from glutamic acid at a position corresponding to amino
XX acid position 153 and tryptophan at position corresponding to amino acid
XX position 329. (I) has hepatotropic activity and can be used in gene
XX therapy. (II) is useful in screening for drugs targeting (II), by
XX contacting a PHK22 polymorphic variant with a candidate agent and
XX assaying for binding activity. The identified candidate agents targeting
XX PHK22, are useful for treating liver cirrhosis and glycogen storage
XX diseases. The present sequence represents a preferred oligonucleotide
XX primer for the PHK22 gene, which is used in the exemplification of the
XX present invention

XX New zinc finger protein that binds to target site, useful in studying
XX gene function and for human therapeutics and plant engineering, comprises
XX first, second and third zinc fingers, ordered from N- to C-terminus.
XX
XX Example 1; Page 47; 81pp; English.
XX
XX The present invention describes a zinc finger protein (I) that binds to a
XX target site, comprising a first (F1), a second (F2), and a third (F3)
XX zinc finger, ordered F1, F2, F3 from N-terminus to C-terminus, where the
XX target site comprises, in 3'-5' direction, a first (S1), a second (S2),
XX and a third (S3) target subsite. Also described are: (1) a polypeptide
XX (II) comprising (I); (2) a polynucleotide (III) encoding (I) or (II); and
XX (3) designing (M) (I) involves selecting the F1 zinc finger such that it
XX binds to the S1 target subsite, selecting the F2 zinc finger such that it
XX binds to the S2 target subsite, and selecting the F3 zinc finger such
XX that it binds to the S3 target subsite, thus designing (I) that binds to
XX a target site. (I) is useful for recognition of triplet target subsites
XX having the nucleotide G in the 5'-most position of the subsite. (I) is
XX useful in studying gene function, and for human therapeutics and plant
XX engineering. (I), (II) or (III) is useful in therapeutic methods to
XX modulate the expression of a target region within a subject, in
XX diagnostic methods for sequence specific detection of target nucleic acid
XX in a sample, and in assays to determine the phenotype and function of
XX gene expression. (I) has improved affinity and specificity for their
XX target sequences, as well as enhanced biological activity. ABQ71213 to
XX ABQ72214 and ABP48191 to ABP51230 represent DNA target sequences and zinc
XX finger peptides which are given in the exemplification of the present
XX invention

PS
XX
CC The sequence represents the terminal sequence of a primer for detecting
CC CYP8B1 gene polymorphisms by primer extension. The invention relates to a
CC novel isolated polynucleotide which is a polymorphic variant of a
CC reference sequence for cytochrome P450 subfamily VIIIB (CYP8B1) gene or
CC their fragment. The polynucleotides of the invention have cardiant
CC activity, and may have a use in gene therapy. A polymorphic variant of
CC the CYP8B1 protein is useful for screening drugs targeting CYP8B1. A
CC haplotype or haplotype pair is useful for improving the efficiency and
CC reliability of several steps in the discovery and development of drugs
CC for treating diseases associated with CYP8B1 activity e.g.,
CC cardiovascular disorders. The invention includes a method for haplotyping
CC CYP8B1 gene in an individual, which can also be used to validate CYP8B1
CC as a candidate target for, and in design of clinical trials of candidate
CC drugs for, treating a specific condition drugs or disease predicted to be
CC associated with CYP8B1 activity. A method is also included for genotyping
CC CYP8B1 gene of an individual which can also be used in developing
CC diagnostic tests and therapeutic treatments. The advantage to this is
CC that without requiring any a prior knowledge of the phenotypic effect of
CC any particular CYP8B1 haplotype or haplotype pair, the invention provides
CC a method to identify lead compounds that are more likely to show efficacy
CC in clinical trials

XX Claim 17; Page 19; 158pp; English.
PS
XX
CC The invention relates to a method for haplotyping the cytochrome P450,
CC subfamily IID, polypeptide 6 (CYP2D6) gene (ABQ72215, ABQ72364) of an
CC individual, and also describes 29 novel polymorphic sites within the
CC human CYP2D6 gene. The CYP2D6 gene is located on chromosome 22q13.1 and
CC contains 9 exons which encode a 497 amino acid protein (AB090563). CYP2D6
CC is a mono-oxygenase involved in the detoxification of many drugs and
CC environmental chemicals. It plays a role in the metabolism of drugs such
CC as antiarrhythmics, adrenoceptor antagonists and tricyclic
CC antidepressants, and is also involved in the formation of a metabolite
CC linked to the drug-induced lupus syndrome observed with procainamide.
CC Variations in CYP2D6 activity or expression may also influence an
CC individual's susceptibility to environmentally-linked diseases, and it
CC has been demonstrated that CYP2D6 activity may be involved in the
CC pathogenesis of Parkinson's disease, with individuals with a less active
CC form of the enzyme tending to have an earlier onset of this condition.
CC CYP2D6 nucleic acid sequences are useful in studying the expression and
CC function of CYP2D6, and in expressing CYP2D6 protein for use in screening
CC drugs for the treatment of CYP2D6-associated diseases (e.g.,
CC hypertension, atrial and ventricular arrhythmias, Parkinson's disease,
CC CYP2D6 nucleic acids and proteins are also useful in studying the effect
CC of polymorphisms on the biological activity of CYP2D6. Polymorphisms in
CC the target region may be determined by the use of allele-specific
CC oligonucleotides (ASOs; ABQ72217-ABQ72303) as probes and primers, and by
CC primer extension using oligonucleotide primers comprising sequences
CC ABQ72304-ABQ72361. The method of the invention is useful for haplotyping
CC the CYP2D6 gene in populations and in individuals, enabling decisions to
CC be made as to whether CYP2D6 is a likely therapeutic target for a disease
CC of interest, and to control for genetically-based bias in the design of
CC drugs that target or are metabolised by CYP2D6. In addition, transgenic
CC animals comprising a human CYP2D6 gene are useful for studying the
CC expression of CYP2D6 isogenes in vivo, for in vivo screening and testing
CC of drugs targeted to or metabolised by CYP2D6, and for testing the
CC efficacy of therapeutic agents and compounds for treating CYP2D6-
CC associated conditions in a biological system. Sequences ABQ72304-
CC ABQ72361 represent sequences that are specifically claimed as components
CC of primers used to detect polymorphisms in the CYP2D6 gene by primer
CC extension

XX
XX The invention relates to SAGE (serial analysis of gene expression) tags
CC representing groups of genes which are expressed in activated human Th1
CC and/or Th2 cells. The SAGE tags of this invention consist of a sequence
CC of 10 nucleotides located downstream of the 5'-CATG-3' sequence motif
CC lying nearest to the polyA region of cDNAs derived from a variety of
CC genes. These tags serve to uniquely identify each transcript and can thus
CC be used to analyse the pattern of gene expression in particular cell
CC types. The invention also relates to proteins encoded by the genes
CC expressed in Th1 and/or Th2 cells, antibodies against these proteins, and
CC inhibitors of the expression of groups of genes that are expressed in
CC either or both the two cell types. Groups of genes expressed in Th1
CC and/or Th2 cell types may be used for the diagnosis and treatment of Th1
CC and Th2-related disorders. Sequences ABV78561-ABV78610 are SAGE tags
CC representing 50 genes which are more highly expressed in Th2 cells
CC compared with Th1 cells

CC of 10 nucleotides located downstream of the 5'-CATG-3' sequence motif
CC lying nearest to the polyA region of cDNAs derived from a variety of
CC genes. These tags serve to uniquely identify each transcript and can thus
CC be used to analyse the pattern of gene expression in particular cell
CC types. The invention also relates to proteins encoded by the genes
CC expressed in Th1 and/or Th2 cells, antibodies against these proteins, and
CC inhibitors of the expression of groups of genes that are expressed in
CC either or both the two cell types. Groups of genes expressed in Th1
CC and/or Th2 cell types may be used for the diagnosis and treatment of Th1
CC and Th2-related disorders. Sequences ABV78390-ABV78560 are SAGE tags
CC representing 171 genes which are more highly expressed in Th1 cells
CC compared with Th2 cells

PA (KAGA-) KAGAKU GIJUTSU SHINKO JIGYODAN.
XX WPI; 2002-631294/68.
XX Human chronic hepatitis C tissue expression exasperating gene group
PT comprises 100 high-ranking genes.
XX Claim 64; Page 31; 139pp; Japanese.
XX The invention relates to SAGE (serial analysis of gene expression) tags
CC representing groups of genes which are differentially expressed in human
CC chronic hepatitis C (CH) liver tissue or hepatitis C-induced
CC hepatocellular carcinoma (HCC) compared with normal human liver tissue.
CC The SAGE tags of this invention consist of a sequence of 10 nucleotides
CC located downstream of the 5'-CMTG-3' sequence motif lying nearest to the
CC polyA region of cDNAs derived from a variety of genes. These tags serve
CC to uniquely identify each transcript and can thus be used to analyse the
CC pattern of gene expression in particular cell types. The invention also
CC relates to proteins encoded by the genes expressed in chronic hepatitis C
CC liver tissue or HCC, antibodies against these proteins, and inhibitors of
CC the expression of groups of genes that are overexpressed in chronic
CC hepatitis C liver tissue or HCC. Groups of genes differentially expressed
CC in chronic hepatitis C tissue or HCC may be used for the diagnosis and
CC treatment of these diseases. Such genes, inhibitors of their expression
CC or activity, and antibodies against the gene products may be used in the
CC development of drugs to treat chronic hepatitis C and/or HCC. Sequences
CC ABV84891-ABV84990 are SAGE tags representing 100 genes which are highly
CC expressed in hepatocellular carcinoma

PT e.g. neuropsychiatric disorders involving monoaminergic brain systems.
XX
PS Claim 19; Page 15; 183pp; English.
XX
CC The present invention describes an isolated polynucleotide (I) having a
CC sequence (S1) comprising soluble carrier family 18 (vesicular monoamine),
CC member 2 (SLC18A2) isogene selected from 49 isoforms with regions of a
CC sequence (SS) of 40023 bp (see ABL51954), and defined by a corresponding
CC set of polymorphisms whose locations and identities are given in the
CC specification; or a sequence (S2) complementary to (S1). (I) has
CC antiinflammatory and neuroleptic activities, and can be used in gene
CC therapy. Methods from the present invention can be used for haplotyping
CC and genotyping the SLC18A2 gene in an individual. SLC18A2 is also known

CC as the vesicular monoamine transporter (VMAT2). (1) is useful in studying
 CC the expression and function of SLC18A2, and in expressing the SLC18A2
 CC protein for use in screening for candidate drugs to treat diseases
 CC related to SLC18A2 activity and in studying the effect of the variation
 CC on the biological activity of SLC18A2 as well as on the binding affinity
 CC of candidate drugs targeting SLC18A2 for the treatment of respiratory
 CC inflammatory diseases such as neuropsychiatric disorders involving
 CC monoaminergic brain systems. The present sequence represents a preferred
 CC oligonucleotide primer for human SLC18A2, which is given in the present
 CC invention

 PT treating disorders associated with abnormal expression or function of
 PT TACR2 isogene.
 XX
 PS Claim 16; Page 15; 139pp; English.
 XX
 CC The invention relates to an isolated polypeptide comprising a polymeric
 CC variant of a reference sequence for the Tachykinin receptor (TACR2)
 CC protein. Also described is a method for: (1) haplotyping or genotyping
 CC the TACR2 gene of an individual; (2) predicting a haplotype pair for the
 CC TACR2 gene of an individual; (3) identifying an association between a
 CC trait and at least one haplotype or haplotype pair of the TACR2 gene; and
 CC (4) isolated oligonucleotide for detecting a single nucleotide
 CC polymorphism in the TACR2 gene. Polymorphic variants of the TACR2 gene
 CC are useful in studying the expression and biological function of TACR2,
 CC and in identifying drugs targeting TACR2 protein for treating disorders
 CC associated with abnormal expression or function of TACR2, e.g. asthma or
 CC breast cancer. Polynucleotides comprising a polymorphic gene variant or
 CC fragment may be used for therapeutic purposes, where a patient could
 CC benefit from expression or increased expression of a particular TACR2
 CC protein isoform, or an expression vector encoding the isoform may be
 CC administered to the patient. Haplotype information is useful in improving
 CC the efficiency and output of several steps in drug discovery and
 CC development process, including target validation, identifying lead
 CC compounds, and early phase clinical trials. Information on polymorphisms
 CC may be applied in studying biological functions of TACR2 as well as in
 CC identifying drugs targeting this protein for the treatment of disorders
 CC related to its abnormal expression or function. ABS64163-ABS64302
 CC represent human TACR2 gene allele-specific oligonucleotide probes and

 PT Detecting presence of nucleic acid, by conducting nucleic acid polymerase
 PT reaction resulting in production of labeled polyphosphate, permitting
 PT polyphosphate to react with phosphatase to produce a detectable species.

XX
 PS Example 5; Page 51; 52pp; English.

XX The present sequence is a DNA template used in examples from the
 CC invention describing nucleic acid detection using polymerase
 CC incorporation of gamma-phosphate-labelled ddGTP or ddATP. A claimed
 CC method of detecting the presence of a nucleic acid sequence comprises
 CC conducting a nucleic acid polymerase reaction. This involves the reaction
 CC of a nucleotide which is non-reactive to phosphatase and one terminal-
 CC phosphate-labelled nucleotide. The reaction results in the production of
 CC labelled polyphosphate, which reacts with a phosphatase to produce a
 CC detectable species. The method is useful for detecting the presence of a
 CC nucleic acid sequence such as DNA, RNA, a natural or synthetic
 CC oligonucleotide, a chromosome or part of a chromosome

XX Disclosure; Page 19; 118pp; English.
XX
CC The present invention describes a method (M1) for the staged assembly of
CC a nanostructure using peptide nucleic acids (PNAs). M1 comprises: (a)
CC contacting a nanostructure intermediate (NSI) having at least one unbound
CC joining element (JE) with an assembly unit (AU) that comprises several
CC different JE where: (i) none of these JE can interact with itself or
CC other JE; and (ii) only one JE in AU and a single unbound JE in NSI are
CC complementary, so that AU becomes non-covalently linked to NSI to produce
CC a new NSI for use in subsequent cycles; (b) removing unbound AU; and (c)
CC cyclic repetition of (a) and (b) to form a nanostructure. The new feature
CC is that the complementary JE in at least one cycle are PNAs. Also
CC described are nanostructures formed from many AU, comprising different
CC JE, where at least one AU includes PNA. M1 is useful for producing
CC nanostructures with a very wide range of potential applications, e.g.
CC structural reinforcements (for aerogels, paper, plastics or cement,
CC particularly as long fibres to improve tensile strength); identification
CC (anti-counterfeiting) markers; enzyme or catalyst supports; assembly
CC scaffolds; for construction of nanowires or nanocircuits; size markers
CC for electron microscopy; molecular sieves and filters; substrates for
CC optical and other surface coatings; scaffolds for solubilising enzymes or
CC for trapping, protecting and delivering specific molecules; in high-
CC density computer memories; as artificial zeolite for absorbing ions from
CC water and for construction of new materials, including use in biosensors.
CC PNAs are more homogeneous than inorganic nanoparticles generally used to
CC form nanostructures, so will produce structures with predictable geometry
CC and stoichiometry. The present sequence represents a PNA related binding
CC oligonucleotide, which is used in the exemplification of the present
CC invention.

PT A molecule which specifically binds to a site on MN protein (oncoprotein)
PT and prevents adhesion of vertebrate cells to the protein, useful for
PT treating preneoplastic or neoplastic diseases such as cancer.
XX
PS Disclosure; Page 26; 154pp; English.
XX
CC The invention relates to the inhibition of cell adhesion mediated by the
CC MN oncoprotein (also known as the MN/CA IX isoenzyme or the MN/G250
CC protein). The MN protein is a tumour-associated adhesion molecule which
CC comprises a proteoglycan-like (PG) domain (AAB03017) which contains the
CC protein's binding site, and a carbonic anhydrase (CA) domain (AAB03018).
CC Abnormal expression of the MN protein is associated with tumorigenicity.
CC The invention encompasses molecules (e.g., proteins and peptides) which
CC which specifically bind to a site on the MN protein, thereby preventing
CC adhesion of vertebrate cells to the protein in a cell adhesion assay. It
CC also encompasses MN proteins or MN protein fragments which can be added
CC to the extracellular environment to prevent the adhesion of vertebrate
CC cells to each other. The invention also relates to the identification of
CC the binding site of the MN protein and to a method of identifying a site
CC on an MN protein to which cells adhere, comprising testing a series of
CC overlapping peptides from the protein in a cell adhesion assay. The
CC invention encompasses a vector comprising an expression control sequence
CC operatively linked to a nucleic acid encoding the variable domains of a
CC MN-specific antibody, where the domains are separated by a flexible
CC linker peptide (AAB03035) and the vector inhibits the growth of a
CC vertebrate preneoplastic or neoplastic cell that abnormally expresses MN
CC protein. The invention also encompasses a vector comprising a nucleic
CC acid encoding a cytotoxic protein or peptide operatively linked to the MN
CC gene promoter, which inhibits the growth of a vertebrate preneoplastic or
CC neoplastic cell. Also claimed is a repressor complex that binds to the MN
CC gene promoter (AAAS2473). MN proteins and peptides, MN-binding proteins
CC and peptides, and expression vectors encoding such proteins and peptides
CC are useful for treating patients with preneoplastic or neoplastic disease
CC (e.g., cancers) associated with or characterised by abnormal MN
CC expression. The present sequence represents a fragment of the human MN
CC gene (AAAS2462) specified in the invention

New DNAs having keratinocyte gene regulatory distal and proximal elements
for the human K14 gene useful for controlling gene expression,
particularly to sequences for promoting keratinocyte-specific gene
expression.
Example 1; Col 25; 36pp; English.
The present invention relates to the human keratinocyte gene (K14)
transcription proximal element (see AAF75889). The proximal element binds
to keratinocyte nuclear factor (KER1), to control keratinocyte-specific
expression. The proximal element, when located upstream from and proximal
to a transcription initiation site of a selected structural gene, may
confer a keratinocyte-specific, and often epidermal abundant, expression
capability to such a gene. To confer keratinocyte specificity, the
proximal element must be combined with a distal element and a TATA box.
The present sequence is the Xenopus embryo nuclear factor, KTF-1 binding
sequence. This sequence is similar to the KER1 binding site

XX In vitro identification of skin-expressed genes, useful for determining
 PT homeostasis and identifying cosmetic or pharmaceutical agents against
 PT e.g. skin cancer.

XX PS Disclosure; Page 43; 1345pp; German.

XX The invention relates to in vitro identification (M1) of genes expressed
 CC in the skin of humans or animals by subjecting a mixture of genetically
 CC encoded factors from skin, to serial analysis of gene expression (SAGE)
 CC so as to identify skin-expressed genes and quantify their expression.
 CC (M1) is useful for identifying genes involved in skin homeostasis; to
 CC determine skin homeostasis and to test agent (A) that maintains or
 CC promotes skin homeostasis or that can be used for treating skin
 CC disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma;
 CC ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus;
 CC rosacea; melanoma; basal cell carcinoma; and carcinoma of sarcoma of the
 CC skin. The present sequence is that of a human expressed sequence tag
 CC (EST) of the invention

 DR
 XX An isolated molecule comprising an antibody variable region which
 PT specifically binds to an extracellular domain of a tumor endothelial
 PT marker (TEM) protein, useful for inhibiting tumor growth.
 XX
 XX Example 4; Page 324; 331pp; English.
 PS
 XX The invention relates to an isolated molecule comprising an antibody
 CC variable region which specifically binds to an extracellular domain of a
 CC tumour endothelial marker (TEM) protein selected from ABB90732, ABB90740,
 CC ABB90749, ABB90750 and ABB90769. The antibodies which bind to TEM
 CC proteins have cytostatic, immunostimulant and antiangiogenic activity.
 CC They are useful for inhibiting tumour growth, neoangiogenesis in subjects
 CC bearing a vascularised tumour, polycystic kidney disease, diabetic
 CC retinopathy, rheumatoid arthritis and psoriasis. Human, mouse and rat TEM
 CC genes and the encoded proteins (ABL92075-ABL92141 and ABB90721-ABB90789)
 CC are disclosed, as are marker oligonucleotide sequences: tumour
 CC endothelial markers (TEM) ABL91996-ABL92041 and ABL92143-ABL92191; normal
 CC endothelial markers (NEM) ABL92042-ABL92074; and pan-endothelial markers
 CC (PEM) ABL91903-ABL91995. The present sequence is that of an
 CC oligonucleotide marker useful to the invention

 XX New zinc finger protein that binds to target site, useful in studying
 PT gene function and for human therapeutics and plant engineering, comprises
 PT first, second and third zinc fingers, ordered from N- to C-terminus.
 PT
 XX Example 1; Page 56; 81pp; English.
 PS
 XX The present invention describes a zinc finger protein (I) that binds to a
 CC target site, comprising a first (F1), a second (F2), and a third (F3)
 CC zinc finger, ordered F1, F2, F3 from N-terminus to C-terminus, where the
 CC target site comprises, in 3'-5' direction, a first (S1), a second (S2),
 CC and a third (S3) target subsite. Also described are: (1) a polypeptide
 CC (II) comprising (I); (2) a polynucleotide (III) encoding (I) or (II); and
 CC (3) designing (M) (I) involves selecting the F1 zinc finger such that it
 CC binds to the S1 target subsite, selecting the F2 zinc finger such that it
 CC binds to the S2 target subsite, and selecting the F3 zinc finger such
 CC that it binds to the S3 target subsite, thus designing (I) that binds to
 CC a target site. (I) is useful for recognition of triplet target subsites
 CC having the nucleotide G in the 5'-most position of the subsite. (I) is
 CC useful in studying gene function, and for human therapeutics and plant
 CC engineering. (I), (II) or (III) is useful in therapeutic methods to
 CC modulate the expression of a target region within a subject, in
 CC diagnostic methods for sequence specific detection of target nucleic acid
 CC in a sample, and in assays to determine the phenotype and function of
 CC gene expression. (I) has improved affinity and specificity for their
 CC target sequences, as well as enhanced biological activity. ABQ71213 to
 CC ABQ72214 and ABP48191 to ABP51230 represent DNA target sequences and zinc
 CC finger peptides which are given in the exemplification of the present
 CC invention

PT Designing zinc finger protein that has three zinc fingers from N-terminus
PT and C-terminus that bind to subsites in 3' to 5' direction, in a target
PT site, by selecting zinc fingers that bind their respective subsites.
XX
PS Disclosure; Page 22; 34pp; English.
XX
CC The invention relates to a method of designing a zinc finger protein. The
CC method is useful for designing a zinc finger protein. The method provides
CC multi-finger zinc finger proteins with improved affinity and specificity
CC for their target sequences, as well as enhanced biological activity. The
CC present sequence represents a zinc finger protein DNA target sequence.

PT Identifying resistance to fusiform rust disease in trees of the genus
PT Pinus.
XX
PS Example 6; Col 37; 69pp; English.
XX
CC The specification describes a method of identifying a genetic marker
CC associated with a genetic locus conferring resistance to fusiform rust
CC disease in a family of trees of the genus Pinus. The method comprises
CC obtaining a sexually mature Pinus parent tree exhibiting resistance to
CC fusiform rust disease, obtaining a plurality of progeny trees of the
CC parent by self or cross-pollinations, assessing multiple progeny trees
CC for a number of genetic markers, identifying genetic markers segregating
CC in a Mendelian ratio and showing linkage with other genetic markers,
CC measuring resistance to fusiform rust disease in multiple progeny trees
CC and correlating the presence of resistance to fusiform rust disease with
CC at least one marker identified in the previous step. The method is useful
CC for determining the genetic basis of resistance to fusiform rust disease
CC and for producing trees of the Pinus genus that are resistant to the
CC disease. The present primer was to amplify E. grandis coppicing vigour
CC markers, in the course of invention

Detecting a pathogenic fungus in cucumbers, pumpkins and gourds using
recombinant techniques.

Example 3; Page 8; 19pp; English.

This is a commercial oligonucleotide primer for the PCR-based RAPD
analysis of fungal isolates of *Didymella bryoniae* and *Phoma species*. The
new method may be used to distinguish *D. bryoniae* from non-pathogenic
Phoma species fungal infections in Cucurbits (i.e. cucumbers, pumpkins,
watermelons, gourds, cantaloupes, squashes and related plants). The new
method of detection of *D. bryoniae* and *Phoma species* infections allows
rapid diagnosis even before symptoms are visible as compared to prior art
methods which involved growing pure cultures of the pathogens from the
infected plants and identifying them under the light microscope. The
method leads to the early treatment of the infected plants with
fungicides resulting in an increased chance of saving the infected food
crops

XX
XX Claim 1; Page 117; 130pp; English.
PS
XX Sequences AAZ7573-279709 represent SAGE (serial analysis of gene
CC expression) tags used to identify mRNA transcripts encoding
CC immunostimulatory cofactor proteins which are preferentially or
CC differentially expressed in monocyte-derived dendritic cells compared
CC with monocytes. Some of the transcripts correspond to known genes or ESTs
CC (expressed sequence tags) which were previously unknown to be
CC preferentially or differentially expressed in dendritic cells, while
CC other transcripts correspond to novel genes. Antigen-presenting cell
CC (APC)-associated costimulatory factors play an important role in the
CC activation of the cytotoxic immune response, particularly against tumour
CC cells. Tumour antigen presentation via the MHC (major histocompatibility
CC complex) and subsequent recognition by T-cell receptors is alone
CC insufficient to activate a robust cytotoxic immune response that can lyse
CC the tumour cells, immunostimulatory cofactors also being required for
CC efficient activation of cytotoxic T-lymphocytes (CTLs). Nucleic acid
CC sequences identified using the SAGE tags have several potential uses.
CC They may be used in vaccines to induce an immune response, particularly
CC against a tumour antigen; to modulate the genotype of an APC; to screen
CC for agents that modulate expression of differentially expressed genes in
CC an APC; and as hybridisation probes/amplification primers for the
CC diagnosis, prognosis and monitoring of diseases related to abnormal
CC expression of these genes. Detection of the dendritic cell differentially
CC expressed genes, or of their encoded proteins, can be used to identify
CC cells as belonging to the monocyte lineage. Cells containing these genes
CC can be used in active immunotherapy (or to stimulate production of a
CC population of antigen-specific effector cells) and vectors containing
CC them are used in gene therapy. Co-administration of tumour antigens and
CC APC-associated costimulatory factors ensures adequate antigen
CC presentation to endogenous APCs and upregulates the APCs for the

CC presentation of co-stimulatory signals, migration to T cell-rich sites,
CC secretion of T cell growth factors and secretion of chemokines for
CC recruitment of immune effector cells

XX Isolated polynucleotides differentially expressed in antigen-presenting
PT cells, useful in gene vaccines against cancer.

XX Claim 1; Page 125; 130pp; English.

XX Sequences AAZ77573-279709 represent SAGE (serial analysis of gene
CC expression) tags used to identify mRNA transcripts encoding
CC immunostimulatory cofactor proteins which are preferentially or
CC differentially expressed in monocyte-derived dendritic cells compared
CC with monocytes. Some of the transcripts correspond to known genes or ESTs
CC (expressed sequence tags) which were previously unknown to be
CC preferentially or differentially expressed in dendritic cells, while
CC other transcripts correspond to novel genes. Antigen-presenting cell
CC (APC)-associated costimulatory factors play an important role in the
CC activation of the cytotoxic immune response, particularly against tumour
CC cells. Tumour antigen presentation via the MHC (major histocompatibility
CC complex) and subsequent recognition by T-cell receptors is alone
CC insufficient to activate a robust cytotoxic immune response that can lyse
CC the tumour cells, immunostimulatory cofactors also being required for
CC efficient activation of cytotoxic T-lymphocytes (CTLs). Nucleic acid
CC sequences identified using the SAGE tags have several potential uses.
CC They may be used in vaccines to induce an immune response, particularly
CC against a tumour antigen; to modulate the genotype of an APC; to screen
CC for agents that modulate expression of differentially expressed genes in
CC an APC; and as hybridisation probes/amplification primers for the
CC diagnosis, prognosis and monitoring of diseases related to abnormal
CC expression of these genes. Detection of the dendritic cell differentially
CC expressed genes, or of their encoded proteins, can be used to identify
CC cells as belonging to the monocyte lineage. Cells containing these genes
CC can be used in active immunotherapy (or to stimulate production of a
CC population of antigen-specific effector cells) and vectors containing
CC them are used in gene therapy. Co-administration of tumour antigens and
CC APC-associated costimulatory factors ensures adequate antigen
CC presentation to endogenous APCs and upregulates the APCs for the
CC secretion of co-stimulatory signals, migration to T cell-rich sites,
CC secretion of T cell growth factors and secretion of chemokines for
CC recruitment of immune effector cells

 CC useful for treatment of (metastatic) breast cancer, while promoters from
 CC the transcripts are used to direct expression, in selected cell types, of
 CC e.g. therapeutic genes (also ribozymes or antisense sequences).
 CC particularly an antigen-encoding sequence for use in gene or cell-based
 CC vaccines. Polypeptides encoded by the transcripts are also useful in
 CC antibodies; for diagnosing breast cancer and for raising specific
 CC antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic
 CC agents. Host cells that produce the polypeptides can be used to expand
 CC and isolate populations of educated, antigen-specific immune effector
 CC cells, e.g. cytotoxic T lymphocytes, and these used for adoptive
 CC immunotherapy

XX
XX Claim 1; Page 112; 219pp; English.
XX
XX AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts
CC that are preferentially transcribed in the metastatic breast tumour
CC tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942
CC preferentially transcribed in the primary or non-metastatic breast tumour
CC tissue (i.e. are downregulated in metastatic breast tumour cells). These
CC transcripts can be used for diagnosis, prognosis, monitoring and
CC treatment of breast cancer, particularly where metastatic. Diagnosis is
CC by standard immunoassays or hybridisation/amplification reactions.
CC Compounds that modulate expression of the transcripts are potentially
CC useful for treatment of (metastatic) breast cancer, while promoters from
CC e.g. therapeutic genes (also ribozymes or antisense sequences),
CC particularly an antigen-encoding sequence for use in gene or cell-based
CC vaccines. Polypeptides encoded by the transcripts are also useful in
CC antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic
CC agents. Host cells that produce the polypeptides can be used to expand
CC and isolate populations of educated, antigen-specific immune effector
CC cells, e.g. cytotoxic T lymphocytes, and these used for adoptive
CC immunotherapy

CC useful for treatment of (metastatic) breast cancer, while promoters from
CC the transcripts are used to direct expression, in selected cell types, of
CC e.g. therapeutic genes (also ribozymes or antisense sequences),
CC particularly an antigen-encoding sequence for use in gene or cell-based
CC vaccines. Polypeptides encoded by the transcripts are also useful in
CC vaccines; for diagnosing breast cancer and for raising specific
CC antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic
CC agents. Host cells that produce the polypeptides can be used to expand
CC and isolate populations of educated, antigen-specific immune effector
CC cells, e.g. cytotoxic T lymphocytes, and these used for adoptive
CC immunotherapy

XX Groups of genes expressed in human dendritic cells at a greater or lesser
PT extent than in monocytes for investigation and diagnosis of autoimmune
PT disease and tumors.
XX
XX Claim 19; Page 15; 95pp; Japanese.
XX
XX The present invention describes a group of genes consisting of 100 genes
CC which are highly expressed in human dendritic cells; a group of genes
CC which are expressed at a higher frequency in human dendritic cells than
CC in human monocytes; and a group of genes which are expressed at lower
CC frequency in human dendritic cells than in human monocytes. Each group of
CC genes are characterised in that cDNAs of these genes respectively have
CC the base sequences of SEQ ID NO:1 to 100 (AAC73914 to AAC74013), SEQ ID
CC NO:101 to 200 (AAC74014 to AAC74113) and SEQ ID NO:201 to 300 (AAC74114
CC to AAC74213), each is continuous with the base sequence 5'-CATG-3'
CC located most closely to the poly-A region. The sequences can be used for
CC the investigation of the role and mechanism of the involvement of
CC dendritic cells in the immune system and for the study and diagnosis of
CC diseases in which dendritic cells play a significant role, e.g. cancers
CC and autoimmune diseases

 XX Claim 1; Page 55; 97pp; English.
 XX
 CC Sequences AAZ79710-279916 represent SAGE (serial analysis of gene
 CC expression) tags used to identify mRNA transcripts which are
 CC differentially expressed in a variety of normal or malignant cell types.
 CC Some of the transcripts correspond to known genes or ESTs (expressed
 CC sequence tags) which were previously unknown to be preferentially or
 CC differentially expressed in that particular cell type, while other
 CC transcripts correspond to novel genes. The invention also provides a
 CC nucleotide comprising a promoter sequence derived from one of the
 CC differentially expressed genes, which may optionally be operably linked
 CC to a foreign nucleotide sequence, and gene delivery vehicles and host
 CC cells comprising the polynucleotides of the invention. A nucleotide
 CC comprising sequences AAZ79710-279916 may be used in diagnostic procedures
 CC to characterise a cell of a specific tissue type and to determine whether
 CC it is normal or malignant. They may be used to screen for agents that
 CC modulate expression of differentially expressed genes compound. The
 CC promoter/foreign gene construct of the invention may be used for
 CC targeted expression of the foreign gene in a particular cell type. For
 CC example, a promoter derived from a gene preferentially expressed in
 CC dendritic cells (antigen-presenting cells, or APCs), may be operably
 CC linked to a sequence encoding an immunostimulatory molecule and a
 CC sequence encoding an antigen. Such a construct could be transduced into
 CC APCs and would be useful for inducing an immune response by educating
 CC immune effector cells in vivo, or in cancer immunotherapy

XX
XX DNA encoding MTR1 protein, useful e.g. for treating Beckwith-Wiedemann
XX syndrome and tumors, also related proteins and antibodies.
XX
XX Example 2; Fig 2; 46pp; German.
XX
XX This invention describes a novel DNA sequence (I) encoding the MTR1
XX protein that: (i) has at least one biological activity of a TRP
XX (transient receptor potential) family protein; (ii) is connected with
XX etiology of BWS (Beckwith-Wiedemann syndrome) and/or (iii) is connected
XX with tumors involving 11p15.5 abnormalities. The products of the
XX invention have anticancer and developmental activity. MTR1 is involved in
XX regulation of intracellular calcium ion levels, which are essential for
XX cellular responses to hormones and/or growth factors; also in apoptosis
XX
```

CC and cell growth, death and differentiation, and in urogenital diseases,
 CC including polycystic kidney disease. (I) and related ribozymes, antisense
 CC RNA, proteins and antibodies (Ab)) are used to treat or prevent diseases
 CC associated with altered expression of the MTR1 gene or activity of its
 CC protein, or with calcium influx into cells, e.g. BWS, Wilms tumor,
 CC rhabdoid tumors and rhabdomyosarcoma. Probes from (I), or Ab, are also
 CC used for diagnosis of such diseases. (I) can also be used for recombinant
 CC production of MTR1 proteins (II) (used for analysis, characterization and
 CC therapy), as tissue or chromosomal markers, for identifying genetic
 CC diseases and related sequences, as primers for genetic fingerprinting, as
 CC source of oligonucleotides for biochips, and to raise anti-protein or
 CC anti-DNA antibodies. (II) are used to raise Ab, as reagents in
 CC competitive assays for (II), as tissue markers, for identifying
 CC interacting proteins and in screening for (ant)agonists. This sequence
 CC represents human MTR1 gene intron7/exon8 junction region described in the
 CC method of the invention

XX Yeast gene coding sequences comprising NORF genes with serial analysis of
PT gene expression (SAGE) tags, useful for studying, monitoring and
PT affecting phases of the cell cycle.
XX Example; Page 308; 419pp; English.
XX The present invention describes an isolated DNA molecule comprising a
CC coding sequence of a yeast gene selected from a group of 745 NORF (not
CC previously assigned open reading frame; or nonannotated ORF) genes
CC comprising a SAGE (serial analysis of gene expression) tag. Also
CC described are: (1) a method (M1) of using NORF genes to affect the cell
CC cycle comprising administering a NORF gene whose expression varies by at
CC least 10% between any two phases of the cell cycle selected from log

phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression varies as in M1, where a test substance which modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to study, monitor and affect phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAF33268 to AAF4064 represent SAGE tags used in the exemplification of the present invention. XX
XX Yeast gene coding sequences comprising NORF genes with serial analysis of
PT gene expression (SAGE) tags, useful for studying, monitoring and
PT affecting phases of the cell cycle.
XX
XX Example; Page 326; 419pp; English.
XX
XX The present invention describes an isolated DNA molecule comprising a
CC coding sequence of a yeast gene selected from a group of 745 NORF (not
CC previously assigned open reading frame; or nonannotated ORF) genes
CC comprising a SAGE (serial analysis of gene expression) tag. Also
CC cycle comprising administering a NORF gene whose expression varies by at
CC least 10% between any two phases of the cell cycle selected from log
CC phase, S phase and G2/M; (2) a method (M2) for screening candidate
CC antifungal drugs comprising: (a) contacting a test substance with a yeast
CC cell; and (b) monitoring expression of a NORF gene whose expression
CC varies as in M1, where a test substance which modifies the expression of
CC comprising nucleotides of a NORF gene whose expression varies as in M1;
CC and (4) a method (M4) for identifying a candidate drug as a member of a
CC class of drugs having a characteristic effect on gene expression in a
CC yeast cell comprising contacting a yeast cell of at least 1 NORF gene whose
CC monitoring expression in the yeast cell of at least 1 NORF gene whose
CC to study, monitor and affect phases of the cell cycle, the differentially
CC expressed genes may be used as markers of phases of the cell cycle. The
CC methods may be used to identify candidate drugs which affect the cell
CC cycle and for identification of antifungal drugs. AAF33268 to AAF44064
CC represent SAGE tags used in the exemplification of the present invention.
CC AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE
CC method, in the exemplification of the present invention

XX
CC The present invention describes an isolated DNA molecule comprising a
CC coding sequence of a yeast gene selected from a group of 745 NORF (not
CC previously assigned open reading frame; or nonannotated ORF) genes
CC comprising a SAGE (serial analysis of gene expression) tag. Also
CC described are: (1) a method (M1) of using NORF genes to affect the cell
CC cycle comprising administering a NORF gene whose expression varies by at
CC least 10% between any two phases of the cell cycle selected from log
CC phase, S phase and G2/M; (2) a method (M2) for screening candidate
CC antifungal drugs comprising: (a) contacting a test substance with a yeast
CC cell; and (b) monitoring expression of a NORF gene whose expression
CC varies as in M1, where a test substance which modifies the expression of
CC the yeast gene is a candidate antifungal drug; (3) a method (M3) for
CC identifying human genes which are involved in cell cycle progression
CC comprising contacting human DNA with a probe which comprises at least 10
CC contiguous nucleotides of a NORF gene whose expression varies as in M1;
CC and (4) a method (M4) for identifying a candidate drug as a member of a
CC class of drugs having a characteristic effect on gene expression in a
CC yeast cell comprising contacting a yeast cell with a candidate drug and
CC monitoring expression in the yeast cell of at least 1 NORF gene whose
CC expression is affected by the class of drugs. The NORF genes may be used
CC to study, monitor and affect phases of the cell cycle, the differentially
CC expressed genes may be used as markers of phases of the cell cycle. The
CC methods may be used to identify candidate drugs which affect the cell
CC cycle and for identification of antifungal drugs. AAF33268 to AAF44064

XX New genetic variants having polymorphisms in the retinaldehyde-binding
XX protein 1 gene, useful for studying the function of and for expressing
XX RLBPI protein for use in screening drugs for treating diseases related to
XX RLBPI activity.

XX Claim 18; Page 14; 107pp; English.

XX The invention relates to an isolated polynucleotide, which comprises
XX genes and haplotypes of the retinaldehyde-binding protein 1 (RLBPI) gene.
XX The polynucleotide comprises polymorphic sites in the RLBPI gene, which
XX are referred to as PS1-24 to designate the order in which they are
XX located in the gene. Also included are methods for haplotyping or
XX genotyping the RLBPI gene of an individual, a method for predicting a
XX haplotype pair for the RLBPI gene of an individual, a method for
XX identifying an association between a trait and at least one haplotype or

haplotype pair of the RLBP1 gene, a composition comprising at least one genotyping oligonucleotide for detecting a polymorphism in the RLBP1 gene at a PS consisting of PS1-PS24, a kit for genotyping the RLBP1 gene of an individual comprising a set of oligonucleotides designed to genotype each of PS1-PS24 recombinant non-human organisms transformed or transfected with the isolated polynucleotide, where the organism expresses a RLBP1 protein encoded by the first nucleotide sequence or expresses an RLBP1 polypeptide comprising an amino acid sequence that is a polymorphic variant of a reference sequence for the RLBP1 protein or its fragment, an anti-RLBP1 antibody, a method for screening for drugs targeting the isolated polypeptide, and a computer system for storing and analyzing polymorphism data for the RLBP1 oncogene gene. The polynucleotide comprising polymorphisms in the RLBP1 gene is useful in studying the expression and function of RLBP1, and in expressing RLBP1 protein for use in screening candidate drugs to treat diseases related to RLBP1 activity (e.g. autosomal recessive retinitis pigmentosa (arRP)). The methods and haplotypes are useful in improving the efficiency and output of several steps in the drug discovery and development process, including target validation, identifying lead compounds, and early phase clinical trials. These are also useful for designing clinical trials of candidate drugs for treating a specific condition or disease, as well as for screening compounds targeting RLBP1 to treat a specific condition or disease predicted to be associated with RLBP1 activity. The kit and method are useful for determining whether an individual has one of the haplotypes or haplotype pairs cited above. The transgenic animals are useful for studying expression of the RLBP1 isogenes in vivo, for in vivo screening and testing of drugs targeted against RLBP1 protein, and for testing the efficacy of therapeutic agents and compounds for retinal diseases in a biological system. The gene for RLBP1 is located on chromosome 15q26. The present sequence is an allele specific oligonucleotide (ASO) PCR primer for amplifying a nucleic acid containing a polymorphic RLBP sequence, using the primer extension method

XX Novel isolated human coagulation factor XII polynucleotide, F12 useful
PT for treatment of e.g. coronary artery disease, comprises a sequence which
PT is a polymorphic variant of a reference sequence for F12 gene or its
PT fragment.

XX Claim 18; Page 14; 72pp; English.

XX The invention relates to single nucleotide polymorphisms in the gene
CC encoding the human coagulation factor XII (F12) polypeptide. A method for
CC haplotyping the F12 gene in an individual comprises identifying the
CC nucleotide at one or more polymorphic sites and determining whether one
CC of the copies of the gene is defined by one of the F12 haplotypes given
CC in the specification or whether both copies are defined by a haplotype
CC pair. This method is useful in genotyping, whereby all possible haplotype
CC pairs can be assigned to specific genotypes. An association between a
CC trait and a haplotype or haplotype pair of the F12 gene can be identified
CC by comparing the frequency of the haplotype or haplotype pair in a
CC population exhibiting the trait with the frequency of the haplotype or
CC haplotype pair in a reference population, where a higher haplotype
CC frequency in the trait population indicates the trait is associated with
CC the haplotype or haplotype pair. F12 and its corresponding DNA are used
CC for studying the expression and function of F12, for use in screening for
CC candidate drugs to treat disorders related to F12 activity such as
CC coronary artery disease, liver disease, spontaneous abortion, Alzheimer's
CC disease and other diseases associated with defects in blood coagulation.
CC The sequences are also useful for studying the effect of variation on the
CC biological activity of F12 as well as on the binding affinity of
CC candidate drugs targeting F12. Sequences AAS99229-AAS99305 represent
CC probes, primers and primer tails used to detect F12 gene polymorphisms

 CC
 CC New isolated polynucleotide, polymorphic variant of somatostatin receptor
 CC 4 gene, useful for expressing somatostatin receptor 4 protein isoform
 CC used in drug screening techniques.
 CC
 CC Claim 16; Page 14; 83pp; English.
 CC
 CC The invention is an isolated polynucleotide having a somatostatin
 CC receptor 4 (SSTR4) isogene that is one of 13 somatostatin genes as given
 CC in the specification, where each somatostatin gene has specific regions
 CC of a fully defined sequence of 9190 nucleotides as given in the
 CC specification, and is defined by polymorphisms at positions 3922, 4723,
 CC 4754, 4783, 4835, 4874, 4921, 4948, 4986, 5216, 5329 or 5411. The
 CC isolated polypeptide is useful for screening drugs which involves
 CC contacting the polypeptide with a candidate agent and assaying for
 CC binding activity. The isolated polynucleotide is useful for studying

CC expression and function of SSTR4 and expressing SSTR4 protein for use in
 CC screening for candidate drugs to treat diseases related to SSTR4
 CC activity. The polymorphism and haplotype data is useful for validating
 CC whether SSTR4 is a suitable target for drugs of cancer and disorders
 CC related to defects in hormone secretion, screening for such drugs and
 CC reducing bias in clinical trials of such drugs. The polynucleotide is
 CC also useful in gene therapy. The isolated polypeptide is useful in
 CC studying the effect of variation on the biological activity of SSTR4 as
 CC well as on the binding affinity of candidate drugs targeting SSTR4 for
 CC treatment of cancer and disorders related to defects in hormone
 CC secretion. The isolated polypeptide is useful in a variety of drug
 CC screening assays to identify agents that bind specifically to all known
 CC SSTR4 isoforms, and for measuring the binding affinities of one or more
 CC candidate drugs targeting the SSTR4 protein. Predicting a haplotype pair
 CC for SSTR4 gene of an individual is useful for identifying an association
 CC between susceptibility to a disease, staging of a disease, or response to
 CC a drug. This polynucleotide sequence represents a preferred primer for
 CC detecting SSTR4 gene polymorphisms relating to the invention

XX Novel genetic variants of SA (Rat Hypertension-associated) Homolog
 PT isogenes, useful for improving efficiency and reliability in drug
 PT development for treating hypertension.

XX Claim 17; Page 15; 98pp; English.

XX The invention relates to an isolated polynucleotide (I) comprising a
 CC first nucleotide sequence (NSI) comprising SAH (SA, Rat Hypertension-
 CC associated Homologue isogene (II) selected from isogenes 1-15 and 17-20
 CC given in the specification, where each isogene comprises the regions of
 CC NSI and is further defined by the corresponding sequence of single
 CC nucleotide polymorphisms or a second nucleotide sequence (NS2)
 CC complementary to NSI. Alternatively, (I) comprises a coding sequence for
 CC SAH isogenes or fragments. Also included are methods of predicting the
 CC haplotype/genotype of the SAH gene of an individual, identifying an
 CC association between a trait and at least one haplotype or haplotype pair
 CC of SAH genes, an isolated oligonucleotide for detecting a polymorphism in
 CC the SAH gene, a recombinant non-human organism transformed or transfected
 CC with the SAH polynucleotide, an isolated polypeptide comprising an amino
 CC acid sequence which is a polymorphic variant of the SAH protein, a
 CC monoclonal antibody specific for SAH, a computer system for storing and

CC analysing polymorphism data for the SAH gene and a genome anthology for
 CC the SAH gene. The SAH proteins and haplotype/genotype methods are useful
 CC in screening for drugs targeting SAH that are useful for treating
 CC hypertension and for drug discovery, development and target validation.
 CC The antibody is useful in diagnostic, prognostic and therapeutic methods.
 CC The polynucleotides are useful in studying the expression and function of
 CC SAH, in expressing SAH protein for use in screening for candidate drugs
 CC and in studying the effect of the variation on the biological activity of
 CC SAH as well as on the binding affinity of candidate drugs targeting SAH.
 CC The gene for SAH is located on chromosome 16p13.11. The present sequence
 CC is the 3' terminus of an allele specific primer for detecting SAH nucleic
 CC acids bearing a polymorphism using the technique of primer extension

XX Example 1; Page 50; 81pp; English.

XX The present invention describes a zinc finger protein (I) that binds to a
 CC target site, comprising a first (F1), a second (F2), and a third (F3)
 CC zinc finger, ordered F1, F2, F3 from N-terminus to C-terminus, where the
 CC target site comprises, in 3'-5' direction, a first (S1), a second (S2),
 CC and a third (S3) target subsite. Also described are: (1) a polypeptide
 CC (II) comprising (I); (2) a polynucleotide (III) encoding (I) or (II); and
 CC (3) designing (M) (I) involves selecting the F1 zinc finger such that it
 CC binds to the S1 target subsite, selecting the F2 zinc finger such that it
 CC binds to the S2 target subsite, and selecting the F3 zinc finger such
 CC that it binds to the S3 target subsite, thus designing (I) that binds to
 CC a target site. (I) is useful for recognition of triplet target subsites
 CC having the nucleotide G in the 5'-most position of the subsite. (I) is
 CC useful in studying gene function, and for human therapeutics and plant
 CC engineering. (I), (II) or (III) is useful in therapeutic methods to

CC modulate the expression of a target region within a subject, in
CC diagnostic methods for sequence specific detection of target nucleic acid
CC in a sample, and in assays to determine the phenotype and function of
CC gene expression. (I) has improved affinity and specificity for their
CC target sequences, as well as enhanced biological activity. ABQ71213 to
CC ABQ72214 and ABP48191 to ABP51230 represent DNA target sequences and zinc
CC finger peptides which are given in the exemplification of the present
CC invention

 XX New genetic variants of Homeo Box D3 for studying expression and function
 PT of the protein, and for screening drugs to treat diseases e.g.
 PT developmental disorders and tumors.
 XX Claim 18; Page 13; 66pp; English.
 XX The invention relates to genetic variants of the homeo box D3 (HOXD3)
 CC gene. HOXD3 gene includes 9 polymorphic sites PS1-PS9. Haplotypes (HTS)
 CC or haplotype pairs (HP) for PS1-PS9 in the HOXD3 gene are useful for
 CC improving the efficiency and reliability of several steps in the
 CC discovery and development of drugs for treating diseases associated with
 CC HOXD3 activity, e.g., developmental disorders and tumors. HOXD3 isogene
 CC is useful in studying the expression and function of HOXD3 and in
 CC expressing HOXD3 protein for use in screening for candidate drugs to
 CC treat diseases related to HOXD3 activity and in studying the effect of
 CC the variation on the biological activity of HOXD3 as well as on the
 CC binding affinity of candidate drugs targeting HOXD3 for the treatment of
 CC developmental disorders and tumors. An antibody against HOXD3 is useful
 CC in a variety of diagnostic and prognostic formats and therapeutic
 CC methods. A recombinant non-human organism is useful in studying
 CC expression of the HOXD3 isogenes in vivo. Allele-specific
 CC oligonucleotides (ASO) are useful as probes and primers and for assaying
 CC a polymorphism in the target region. The present sequence is a primer
 CC used for detecting human HOXD3 gene polymorphisms

 XX Human chronic hepatitis C tissue expression exasperating gene group
 PT comprises 100 high-ranking genes.
 XX Claim 64; Page 31; 139pp; Japanese.
 XX The invention relates to SAGE (serial analysis of gene expression) tags
 CC representing groups of genes which are differentially expressed in human
 CC chronic hepatitis C (CH) liver tissue or hepatitis C-induced
 CC hepatocellular carcinoma (HCC) compared with normal human liver tissue.
 CC The SAGE tags of this invention consist of a sequence of 10 nucleotides
 CC located downstream of the 5'-CATG-3' sequence motif lying nearest to the
 CC polyA region of cDNAs derived from a variety of genes. These tags serve
 CC to uniquely identify each transcript and can thus be used to analyse the
 CC pattern of gene expression in particular cell types. The invention also
 CC relates to proteins encoded by the genes expressed in chronic hepatitis C
 CC liver tissue or HCC, antibodies against these proteins, and inhibitors of
 CC the expression of groups of genes that are overexpressed in chronic
 CC hepatitis C liver tissue or HCC. Groups of genes differentially expressed
 CC in chronic hepatitis C tissue or HCC may be used for the diagnosis and
 CC treatment of these diseases. Such genes, inhibitors of their expression
 CC or activity, and antibodies against the gene products may be used in the
 CC development of drugs to treat chronic hepatitis C and/or HCC. Sequences
 CC ABV84891-ABV84990 are SAGE tags representing 100 genes which are highly
 CC expressed in hepatocellular carcinoma

XX PT Novel isolated polynucleotide which is a polymorphic variant of

cytochrome P450, subfamily IIIA, polypeptide 5 (CYP3A5) gene useful for
expressing CYP3A5 protein isoform used in drug screening techniques.
Claim 17; Page 16; 127pp; English.
The invention relates to isolated polynucleotide having cytochrome P450,
subfamily IIIA, polypeptide 5 isogene (CYP3A5). The invention is useful
for screening drugs. The invention is useful for studying expression and
function of CYP3A5 and expressing CYP3A5 protein for use in screening for
candidate drugs to treat diseases related to CYP3A5 activity. The
polymorphism and haplotype data is useful for validating whether CYP3A5
is a suitable target for drugs to treat drug metabolising disorders,
screening for such drugs and reducing bias in clinical trials of such
drugs. The invention is also useful for therapeutic purposes. The
invention is useful in studying the effect of variation on the biological
activity of CYP3A5 as well as on the binding affinity of candidate drugs
to CYP3A5, or for studying the enzymatic properties of such CYP3A5
variants using these candidate drugs as substrate. The invention is
useful in gene therapy. The present sequence is human CYP3A5 gene
polymorphism detecting primer

XX PT New polymorphic variants comprising interleukin-8 receptor beta (IL8RB)
XX PT isogene, useful in expressing IL8RB protein for use in screening for
XX PT candidate drugs to treat diseases related to IL8RB activity, e.g.
XX PT inflammatory disorders.
XX PS Claim 18; Page 14; 74pp; English.
XX CC The invention relates to single nucleotide polymorphisms in the human
XX CC interleukin 8 receptor beta (IL8RB) gene. A method for haplotyping the
XX CC IL8RB gene in an individual comprises identifying the nucleotide at one

```

CC or more polymorphic sites and determining whether one of the copies of
 CC the gene is defined by one of the IL8RB haplotypes given in the
 CC specification or whether both copies are defined by a haplotype pair.
 CC This method is useful in genotyping, whereby all possible haplotype pairs
 CC can be assigned to specific genotypes. An association between a trait and
 CC a haplotype or haplotype pair of the IL8RB gene can be identified by
 CC comparing the frequency of the haplotype or haplotype pair in a
 CC population exhibiting the trait with the frequency of the haplotype or
 CC haplotype pair in a reference population, where a higher haplotype
 CC frequency in the trait population indicates the trait is associated with
 CC the haplotype or haplotype pair. IL8RB and its corresponding DNA are used
 CC for studying the expression and function of IL8RB, for use in screening
 CC for candidate drugs to treat diseases related to IL8RB activity, such as
 CC chronic obstructive pulmonary disease and other inflammatory disorders.
 CC The sequences are also useful for studying the effect of variation on the
 CC biological activity of IL8RB as well as on the binding affinity of
 CC candidate drugs targeting IL8RB. Sequences AAS95525-AAS95579 represent
 CC allele-specific oligonucleotide probes, sequencing primers and PCR
 CC primers used to detect IL8RB gene polymorphisms

XX New isolated polymorphic variant of human angiotensin receptor-like 1
 PT (AGTRL1) gene useful for expressing AGTRL1 protein isoform to screen
 PT drugs to treat AGTRL1 activity-related disease.

XX Claim 18; Page 13; 71pp; English.

XX The invention relates to single nucleotide polymorphisms in the gene
 CC encoding the human angiotensin receptor-like 1 (AGTRL1) polypeptide. A
 CC method for haplotyping the AGTRL1 gene in an individual comprises
 CC identifying the nucleotide at one or more polymorphic sites and
 CC determining whether one of the copies of the gene is defined by one of
 CC the AGTRL1 haplotypes given in the specification or whether both copies

CC are defined by a haplotype pair. This method is useful in genotyping,
 CC whereby all possible haplotype pairs can be assigned to specific
 CC genotypes. An association between a trait and a haplotype or haplotype
 CC pair of the AGTRL1 gene can be identified by comparing the frequency of
 CC the haplotype or haplotype pair in a population exhibiting the trait with
 CC the frequency of the haplotype or haplotype pair in a reference
 CC population, where a higher haplotype frequency in the trait population
 CC indicates the trait is associated with the haplotype or haplotype pair.
 CC AGTRL1 and its corresponding DNA are used for studying the expression and
 CC function of AGTRL1, for use in screening for candidate drugs to treat
 CC diseases related to AGTRL1 activity, such as hypertension. The sequences
 CC are also useful for studying the effect of variation on the biological
 CC activity of AGTRL1 as well as on the binding affinity of candidate drugs
 CC targeting AGTRL1. Sequences ABK16638-ABK16682 represent allele-specific
 CC oligonucleotide probes, sequencing primers and PCR primers used to detect
 CC AGTRL1 gene polymorphisms

XX Novel genetic variants of beta-3-adrenergic receptor gene useful in
 PT studying expression and function of the protein, and for screening drugs
 PT to treat diseases e.g. obesity, non-insulin dependent diabetes mellitus.

XX Claim 19; Page 15; 91pp; English.

XX The present invention relates to a new polypeptide comprising a sequence
 CC which is a polymorphic variant of a reference sequence for ADRB3 (beta-3-
 CC adrenergic receptor) protein. The reference sequence comprises a sequence
 CC of 408 amino acids as given in the specification, or its fragment, and
 CC the polymorphic variant comprises one or more variant amino acids. The
 CC polymorphic variants are useful in studying the expression and function
 CC of ADRB3, in expressing ADRB3 protein for use in screening for candidate
 CC drugs to treat diseases related to ADRB3 activity, in studying the effect

CC of the variation on the biological activity of ADRB3, and the binding
 CC affinity of candidate drugs targeting ADRB3 for the treatment of
 CC disorders such as morbid obesity, insulin resistance and an early onset
 CC of non-insulin-dependent diabetes mellitus. Haplotyping methods are
 CC useful in validating ADRB3 as a candidate target for treating a specific
 CC condition or disease predicted to be associated with ADRB3 activity, or
 CC in the design of clinical trials of candidate drugs for treating a
 CC specific condition or disease associated with ADRB3 activity. The present
 CC nucleic acid sequence represents one of a collection of oligonucleotide
 CC primers (ABK11489- ABK11512) that were used in the methods of the
 CC invention to detect polymorphisms in the human ADRB3 gene

PT (TACR2) protein, useful for studying the function of TACR2, and for
PT treating disorders associated with abnormal expression or function of
PT TACR2 isogene.
XX
XX
PS Claim 16; Page 15; 139pp; English.
XX
XX The invention relates to an isolated polypeptide comprising a polymorphic
CC variant of a reference sequence for the Tachykinin receptor (TACR2)
CC protein. Also described is a method for: (1) haplotyping or genotyping
CC the TACR2 gene of an individual; (2) predicting a haplotype pair for the
CC TACR2 gene of an individual; (3) identifying an association between a
CC trait and at least one haplotype or haplotype pair of the TACR2 gene; and
CC (4) isolated oligonucleotide for detecting a single nucleotide
CC polymorphism in the TACR2 gene. Polymorphic variants of the TACR2 gene
CC are useful in studying the expression and biological function of TACR2,
CC and in identifying drugs targeting TACR2 protein for treating disorders
CC associated with abnormal expression or function of TACR2, e.g. asthma or
CC breast cancer. Polynucleotides comprising a polymorphic gene variant or
CC fragment may be used for therapeutic purposes, where a patient could
CC benefit from expression or increased expression of a particular TACR2
CC protein isoform, or an expression vector encoding the isoform may be
CC administered to the patient. Haplotype information is useful in improving
CC the efficiency and output of several steps in drug discovery and
CC development process, including target validation, identifying lead
CC compounds, and early phase clinical trials. Information on polymorphisms
CC may be applied in studying biological functions of TACR2 as well as in
CC identifying drugs targeting this protein for the treatment of disorders
CC related to its abnormal expression or function. ABS64163-ABS64302
CC represent human TACR2 gene allele-specific oligonucleotide probes and

XX Identifying lung cancer as squamous cell carcinoma or adenocarcinoma, by
PT determining level of product of gene e.g., glutathione peroxidase,
PT peroxiredoxin 1 and small proline-rich protein 3 in lung cancer sample.

XX Example 10; Fig 2C; 26pp; English.

XX The present invention describes a method for identifying lung cancer as
CC squamous cell carcinoma, which involves determining in an amount of a
CC gene product of a gene in a lung cancer sample, the gene selected from
CC glutathione peroxidase (GPX; NM_002083), glutathione S-transferase M3
CC (GSTM3; NM_000849), aldo-ketoreductase family 1, member B 10 (NM_020299),
CC peroxiredoxin 1 (PRDX1; NM_002574), small proline-rich protein 3 (SPRR3;
CC NM_005416), and tumour necrosis factor (TNF) receptor superfamily member
CC 18 (TNFRSF18; NM_004195), comparing the amount of the gene product to the
CC amount determined in a lung tissue sample which is non-pathological,
CC where an increased amount of the gene product in the lung cancer sample
CC relative to the lung tissue sample which is non-pathological identifies
CC the lung cancer as a squamous cell carcinoma. Also described is a method
CC for identifying a lung cancer as adenocarcinoma, which involves
CC determining an amount of a gene product of a small proline-rich protein 3
CC gene in a lung cancer sample, comparing the amount of the gene product to
CC the amount determined in a lung tissue sample which is non-pathological,
CC where a decreased amount of the gene product in the lung cancer sample
CC relative to the lung tissue sample which is non-pathological identifies
CC the lung cancer as adenocarcinoma. The methods are useful for identifying
CC lung cancers as a squamous cell carcinoma or an adenocarcinoma. The
CC present sequence represents an oligonucleotide which is used in an
CC example from the present invention

US-09-866-108A-9836/c
; Sequence 9836, Application US/09866108A
; Patent No. 6686188
; GENERAL INFORMATION:
; APPLICANT: GU, Yizhong
; APPLICANT: JI, Yonggang
; APPLICANT: PENN, Sharron G.
; APPLICANT: HANZEL, David K.
; APPLICANT: RANK, David R.
; APPLICANT: CHEN, Wensheng
; APPLICANT: SHANNON, Mark
; TITLE OF INVENTION: MYOSIN-LIKE GENE EXPRESSED IN HUMAN HEART AND MUSCLE
; FILE REFERENCE: AEOMICA-7
; CURRENT APPLICATION NUMBER: US/09/866,108A
; CURRENT FILING DATE: 2001-05-25
; PRIOR APPLICATION NUMBER: US 60/207,456
